GENERAL REVIEW OF THE MANUFACTURING INDUSTRIES OF CANADA 1954

Published by Authority of
The Right Honourable C. D. Howe, Minister of Trade and Commerce

NOTICE

The annual reports prepared by the Industry and Merchandising Division of the Bureau of Statistics are divided into 3 volumes, as follows: Volume I - The Primary Industries, including mining, forestry and fisheries; Volume II - Manufacturing; Volume III - Merchandising and Services. The volumes are made up of parts, and the parts in turn are subdivided according to the industries or provinces which they comprise.

Volume II consists of the following parts, the first two of which deal with manufacturing as a whole and the balance with the major manufacturing groups.

I - General Review of the Manufacturing Industries

II — The Manufacturing Industries of Canada

Section A. Summary for Canada

Section B. Atlantic Provinces

Section C. Quebec

Section D. Ontario

Section E. Prairie Provinces

Section F. British Columbia

Section G. The Manufacturing Industries of Canada. Regional Distribution

III - Foods and Beverages

IV - Tobacco and Tobacco Products

V - Rubber Products

VI - Leather Products

VII - Textile Mills

VIII - Knitting Mills

IX - Clothing

X - Wood and Paper Products

XI - Printing Trades

XII - Iron and Steel Products

XIII - Transportation Equipment

XIV - Non-ferrous Metal Products

XV - Electrical Apparatus and Supplies

XVI - Non-metallic Mineral Products XVII - Products of Petroleum and Coal

XVIII - Chemicals and Allied Products XIX - Miscellaneous Manufactures

The present report is the only one in Part I

PART I GENERAL ANALYSES OF MANUFACTURING

SECTION I. GROWTH OF MANUFACTURING

In this report the manufacturing industries of Canada are dealt with in two Parts. Part I gives general analyses including the historical development of manufacturing; detailed treatment of current production under various groupings and by individual industries; and principal factors in manufacturing production such as physical volume of production, capital, employment, salaries and wages, size of establishment, and power and fuel. Part II deals with the provincial and local distribution of manufacturing production.

With regard to historical development, it is impossible to give absolutely comparable statistics over a long period of years. From 1870 to 1915 statistics were collected only in connection with decennial or quinquennial censuses, and there was inevitably some variation in the information collected. The annual Census of Manufactures was instituted in 1917 and while numerous changes have been made since then in the information collected and the treatment of the data, an effort has been made to carry all major revisions, in so far as possible, back to 1917 so that the figures for the period since then are on a reasonably comparable basis.

The manufacturing industries of Canada experienced a downward adjustment during 1954. Both value of shipments and employment were moderately lower than in 1953 which was a peak year. Shipments at \$17,554,527,504 were 5.4 p.c. lower. This was accompanied by an increase of 3.0 p.c. in finished goods inventory which rose to \$1,011,106,831 from \$959,554,911 the previous year, thus indicating a smaller decrease in production than in shipments. The decline in employment was sharper, dropping to 1,267,966 persons or 4.5 p.c. However, due to increases in hourly earnings, the amount paid in salaries and wages, amounting to \$3,896,687,691 was only 1.5 p.c. lower. In physical output the trend was also downward with a decline of 4.4 p.c. for manufacturing as a whole. Non-durable goods were 1.1 p.c. lower while durable goods with a drop of 8.1 p.c. were the most severely affected. The greatest decline in volume output was reported by the transportation equipment group with a decrease of 18.7 p.c., textiles 14.2 p.c., iron and steel products 13.4 p.c. and clothing including knitting mills 13,1 p.c. A few other groups had moderate declines of 2 to 6 per cent. The picture was not completely dark; there were a few bright spots too. Such groups as foods, paper products, printing and publishing, products of petroleum and coal, non-ferrous metal products, and non-metallic mineral products reported increases of 1 to 5 per cent, while chemicals and allied products remained practically unchanged,

The industrial expansion of Canada since Confederation has been phenomenal. In the past generation alone, Canada has changed from a country producing and exporting mainly primary products to a country that is increasingly producing and exporting manufactured products, until to-day manufactures account for about 30 p.c. of the value of all goods and services produced, and also rank as the leading employer of labour in Canada.

Canada is no longer on the fringes of industrialization but ranks among the world's most important manufacturing countries. Basic historical developments, such as the opening of the West and the magnitude of requirements of all kinds for World Wars I and II, have been followed by recent discoveries of far-reaching significance. Such events as the discovery of a major oil pool on the prairies in 1947, the discovery of large-scale deposits of iron and the successful search for uranium have given new dimensions to Canadian thinking and business planning. These are the factors that explain the records of capital expenditures year by year since the end of the War. Yet it is not the mere rate of expansion that is significant. There have been other periods when Canada's population has grown more rapidly and

in many respects the rate of industrial expansion in the late 1920's was relatively as great as in the post-war years. The real significance of the latter period is that never before has there been an advance on such a broad insustrial front.

The second point to be observed is the changing emphasis of Canadian manufacturing activity. By 1949 the period of postwar conversion was passed and Canada had entered a new phase of economic expansion which derived its dynamic from the discovery of new resources and the application of new processes. This meant that even the sharp recession in the United States in the year 1949 failed to have significant effects in Canada. The influence of Korea and the consequent rearmament program gave an added impetus to the expansion of Canadian industry and to the development of Canadian basic resources. Capital expenditures that contributed most to the defence of Canada were given priority, Additional capacity was created to meet requirements of the specialized defence program - aircraft, electronic equipment, ships and guns - many items of which had never before been produced in Canada. Measures such as steel control, credit regulations and deferred depreciation had the desired effect. A shift gradually took place toward the further expansion of basic industrial capacity and away from investment in consumer goods and services.

The stability of current levels of manufacturing is indicated by the fact that such activity is the result of business assessments of resources and market potentialities. Millions of dollars are being invested in oil because the prairies can produce oil as economically as other great fields on the North American Continent. Petro-chemical plants are being erected because the raw materials are readily at hand. Kitimat is based on the coincidence of abundant and cheap hydro-power and access to ocean transportation, both of which are essential to the low-cost production of aluminum. The exploitation of the Ungava iron deposits rests on the belief that the steel industry of the North American Continent will need the high-grade ores involved in order to meet continuing peace-time demands. No country is in a more-favourable position than Canada to supply uranium for the production of atomic energy.

Of strategic importance, and probably of even greater long-term significance to the Canadian economy, has been the growing world-wide shortage of raw materials; a shortage born of rising levels of employment and income, and accentuated by the course of international events, especially since 1950. These demands have shown few signs of abating and they have led to substantial increases in Canadian primary manufacturing capacity, particularly in so far as the light metals, nickel, chemical fertilizers and the cheaper grades of paper are concerned.

In recent years the demands stemming from population growth and a rising standard of living have been noticeable at all levels. In food precessing, a steady up-grading in the quality of foods sold on the domestic market has been even more important than population growth. The two together have almost doubled the dollar sales of processed foods in this country since 1945. And at the intermediate level other important changes have taken place. Many of Canada's new chemical plants, for example, have been built with the domestic consumer market in mind. Frequently using petroleum or natural gas as a source of raw material, they have gone a long way towards making Canada independent of imports in such categories as vanillin, nylon and rayon intermediates, and plastics for packaging and similar uses.

As mentioned above, the physical volume of production in 1954 was down 4.4 p.c., with the durable goods industries reporting a drop of 8.1 p.c. and non-durable goods 1.1 p.c.

In the durable goods sector only two groups out of seven reported increases in volume of production. These two were: non-metallic mineral products with an increase of 2.6 p.c. and non-ferrous metal products with 1.4 p.c. Reflected in these increases is the rise in production of aluminum from 548,445 to 557,897 tons, nickel from 143,643 to 166,299 tons and cement from 22,238,335 to 22,437,477 barrels.

The largest decline of 18.7 p.c. was reported by the transportation equipment group. This was reflected in the drop of motor vehicle production which declined from 486,049 units in 1953 to 352,109 units in 1954, as well as a drop in the value of automobiles and parts exported which fell from \$75,318,523 in 1953 to \$27, 102,946 in 1954. The next highest decline of 13.4 p.c. was reported by the iron and steel group. The output of pig iron in 1954 at 2,211,029 tons was 29.9 p.c. lower than in the previous year, while steel ingots at 3,195,030 was 22.4 p.c. lower. The output of the wood products group which was 2.1 p.c. lower is accounted for mainly by lower exports of wood products. Exports of planks and boards declined by 16.6 p.c., veneers and plywoods 11.8 p.c. and shingles 10.0 p.c. The electrical apparatus and supplies group, in spite of an increase in the production of television sets from 391,974 to 611,206 units, reported a decline of 1.8 p.c. in volume. The miscellaneous industries group dropped 4.7 p.c.

In the non-durable goods sector the trend was mixed. Six groups of industries reported increases while five groups reported declines. Of the groups reporting lowered volume of production, the textile group was the most severely affected with a drop of 14.2 p.c. Next in severity was clothing with a 13.1 p.c. decline. Other groups showing declines were: leather products 5.9 p.c., rubber products 4.4 p.c. and beverages 2.4 p.c.

Of the groups reporting increased volume, the printing and publishing group led with 4.9 p.c. This was followed by paper products with 4.0 p.c., products of petroleum and coal 3.9 p.c., tobacco products 3.6 p.c., foods 2.1 p.c. and chemical products 2 p.c.

Manufacturing establishments reporting in 1954 numbered 38,028. Of these 790 were located in Newfoundland, 209 in Prince Edward Island, 1,526 in Nova Scotia, 1,057 in New Brunswick, 12,191 in Quebec, 13,178 in Ontario, 1,522 in Manitoba, 1,010 in Saskatchewan; 2,052 in Alberta, 4,462 in British Columbia, and 31 in the Yukon and Northwest Territories. These plants furnished employment to 1,267,966 persons who received \$3,896,687,691 in salaries and wages. They also shipped goods with a selling value at the factory of \$17,554,527,504 and spent \$9,241,857,554 for materials, while the value added by manufacture totalled \$7,902,124,137. The value added is obtained by subtracting the cost of materials, including fuel and electricity, from the gross value of products. The difference represents the value added to the materials by labour. It is this difference which the employer of labour uses to pay for the labour itself, the overhead expenses, interest and profits.

To calculate the value of production, it is necessary to adjust the value of shipments for the difference in the opening and closing inventories of finished goods. As the census of industry schedules for 1952 and 1953 did not contain data on opering and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added is obtained by subtracting from the shipments the cost of materials, including fuel and electricity. The value thus obtained is somewhat different to the actual value. Beginning with 1954 it will again be possible to obtain value of production figures, by adding to the value of shipments the changes in the inventory of finished products. The figures for value added in 1954 are, therefore, comparable with 1951 and prior years.

The value added by manufacture in 1954 for manufacturing as a whole is \$7,902,124,137. This is about \$38,000,000 lower than the results obtained when the conversion formula of shipments to value of production is used. This is due to the fact that in a few industries value of production figures are still being collected, while the total figures of inventory change also include the inventory of these industries.

Percentage variation of manufacturing in Canada, by Provinces and Groups, 1954 compared with 1953

	1954 compared with 1953

^{1.} See footnote 3 Table 3.

^{2.} See footnote 4 Table 3.

Tables 1 to 3 give a picture of the growth of manufacturing, in general, as shown by comparable principal statistics, i.e., establishments, capital, employees, salaries and wages paid, cost of materials and values of products. A number of interesting comparisons are made in Table 4 and figures of consumption are given in Table 6.

TABLE 1. Summary Statistics of Manufactures, 1917-54

Note. Statistics of manufacturing from 1870 have been published, but between that year and 1917 they are not on a comparable basis to the series given below. They will be found in Table 1 in the 1942 edition of this report. Statistics of the non-ferrous metal smelting industries were included in manufactures for the first time in 1925.

Year ·	Estab- lish- ments	Capital	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture 1	Gross value of products

^{1.} For 1924 and subsequent years the value added by manufacture is computed by subtracting the cost of fuel and electricity and the cost of materials from the gross value. Figures prior to 1924 are not comparable because statistics for cost of electricity are not available.

2. A change in the method of computing the number of wage-earners in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931, however, the method in force prior to 1925 was re-adopted.

3. Not collected.

4. Includes Nature along.

 ^{4.} Includes Newfoundland.
 5. In 1952 the basis of collection was changed from "value of products made" to "selling value of factory shipments"

TABLE 2. Summary Statistics of Manufactures, by Provinces, Significant Years, 1917-54

Province and Year	Estab- lish- ments	Capital	Em- ployees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Gross value of products

Increase is due to the inclusion for the first time of establishments that publish periodicals without doing any printing.

^{1.} Increase is due to the inclusion for the first time of establishments that publish periodicals without doing any princing.

2. See footnote 5, Table 1.

3. There were three major changes in concept affecting the data for the Primary Iron and Steel Industry in 1954. The first one involved a change in the method of counting establishments; the second concerned a change in valuing shipments of wire rods transferred to makers' own processing plants; while the third concerned the method of calculating 'value added by manufacture''. Figures for 1954 are therefore not comparable with previous years, See footnotes to Table 2 of the 1954 report on the Primary Iron and Steel Industry.

4. Apparent advance in the selling value of factory shipments is due in part to an actual gain in physical output, but the major factor contributing to this increase was a change in accounting procedure by some firms of the petroleum products industry in calculating value of factory shipments. This increased the value by approximately \$139,000,000 over what the value would have been by the former method.

Significant Changes in Manufacturing Production. - The figures in Table 4 trace the tendencies in Canadian manufacturing industries as clearly as possible from 1917 to 1954. In analysing statistics of production and materials used, price changes should be borne in mind, particularly the inflation of values in the years immediately following World War I, the drop in prices of commodities during the depressions following 1921 and 1930, and the increases again in the recent war and postwar period. The figure that shows most clearly the trend of development is concerned with the use of power. The total horse-power employed increased from 1,658,475 in 1917 to 10,397,703 in 1953, an advance of about 527 p.c. in 37 years. In the same period, horse-power per production employee showed an uninterrupted trend from 3.06 to 10.82 in 1933 and 9.46 in 1939. With the large increase in the number of production employees on war production, and the more efficient utilization of the equipment available, the horse-power per production employee dropped to 6.28 in 1944; the increasing installation of power machinery and the decline in employment after the war resulted in a rise to 8.52 in 1948 and 9.87 in 1953. The significant feature is the increase in both the absolute figures of power employed and the averages per production employee during the depression years as compared with 1929, although the large numbers of persons again finding employment since 1933 reduced the averages for the years 1934 to 1937 and again for 1940 to 1945. Other interesting comparisons are the trend of value added by manufacture, per employee, and of average earnings since 1929. Between 1949 and 1954 the value of purchased fuel and electricity increased by 38.8 per cent; for full details of fuel and electricity used by the manufacturing industries see Tables 57 and 58.

^{1.} A change in the method of computing the number of production workers in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. There was, therefore, a proportionate reduction in the averages for 1925-30 per employee as compared with what these averages would have been under the other method. In 1931, however, the method in force prior to 1925 was re-adopted. The figures for 1932 for later years are therefore comparable with those for 1924 and earlier years.

2. Collected only every five years. These figures are for 1953 which is the latest year available.

3. See fottnote 1, Table 1.

4. See footnote 5, Table 1.

Recent Changes in Manufacturing Production. - Table 5 shows the changes in the nature of manufacturing production since the end of World War II with regard to numbers employed, the salaries and wages paid, and the gross value of products. Owing to price declines during depressions and rises during periods of prosperity, the values of both wages and products are naturally affected more than the number of employees. Furthermore, during periods of curtailed production there is a tendency for production workers to be put on part time, while the number of office employees responds less quickly to reduction in output than that of production workers. Therefore, there are several reasons why the variation in number of employees should be less than that of money values. The figures of Table 5 are to be compared with those of Tables 8, 9 and 10 which show changes in volume of production. The number of employees in 1944 increased by 86 p.c. over 1939. Salaries and wages paid were 175 p.c. higher and the gross value of production 161 p.c. higher. Another significant change is the increase in the proportion of women engaged in manufacturing. Whereas in 1939, there were 281 females to every 1,000 males employed, in 1944 this figure jumped to 403.

Significant changes in the nature of manufacturing production took place after the cessation of hostilities in 1945. Industries engaged in war production operated at a substantially lower level, while industries producing consumer goods stepped up their production. From the point of view of employment the chemical and allied products group with a drop of 33 p.c. experienced the greatest decline in production between 1945 and 1949. Transportation equipment which includes aircraft and shipbuilding was second with a drop of 32 p.c., followed by tobacco and tobacco products with 12 p.c., rubber goods 12 p.c. and iron and steel products 3 p.c. The non-metallic mineral products group reported the greatest gain in employment with an increase of 39 p.c., followed by printing, publishing and allied trades 31 p.c., wood products 29 p.c., electrical apparatus and supplies 27 p.c., products of petroleum and coal 26 p.c., paper products 21 p.c., textiles (except clothing) 19 p.c., clothing (textile and fur) 18 p.c., foods and beverages 8 p.c., leather products 2-p.c. and non-ferrous metal products 1-p.c.

For manufacturing as a whole there was an increase of 4 p.c. in the number of employees with an increase of 39 p.c. in the amount of salaries and wages paid. Although there was an increase of 50 p.c. in the gross value of production, the increase in the physical volume was only 3.4 p.c. This is due to the rise in the wholesale prices of fully and partly manufactured products.

Between 1949 and 1954, for manufacturing as a whole, there was an increase of 40.6 p.c. in the gross value of production, 8.1 p.c. in employment, and 75.5 p.c. in salaries and wages paid. In terms of employment, the electrical apparatus and supplies group with an increase of 34.3 p.c. experienced the greatest expansion since 1949. Transportation equipment came second with 27.4 p.c., followed by non-metallic mineral products with 25.2, chemicals and allied products 24.9, products of petroleum and coal 20.7, miscellaneous industries 17.7, paper products 14,3, non-ferrous metal products 13,0, and printing. publishing and allied industries 11.0. The smallest gain was reported by the rubber products group with 0.8 p.c. Four groups reported declines in employment. Textiles led the list with a drop of 17.0 p.c., followed by leather products with 11,9, tobacco and tobacco products 11.4 and clothing 5.5.

Significant changes have also occurred regionally between 1949 and 1954. In terms of employment, there was an increase of 8.1 p.c. for Canada as a whole. With the exception of two provinces, New Brunswick and Manitoba, all other provinces reported increased employment in manufacturing. Alberta led in this respect with an increase of 24.0 p.c., followed by British Columbia with 15.6 p.c., Newfoundland 13.2 p.c. and Quebec 8.7 p.c. These four provinces were above the Canadian average of 8.1 p.c. Four other provinces also reported increases in employment, but below the Canadian average. Of these Ontario reported an increase of 7.5 p.c., Saskatchewan 6.3 p.c., Prince Edward Island 1.5 p.c. and Nova Scotia 1.0 p.c. Of the two provinces reporting declines New Brunswick suffered a drop of 5.7 p.c. and Manitoba a drop of 1.7 p.c. The following table gives the changes which have taken place in manufacturing during the past ten years, on an industrial as well as a geographical basis.

Exclusive of Newfoundland in columns 1, 2 and 3; inclusive of Newfoundland in columns 4, 5 and 6. Exclusive of "Publishing (only) of Periodicals in columns 1, 2 and 3. Newfoundland and "Publishing (only) of Periodicals" are excluded in columns 1, 2 and 3, but are included in columns 4, 5 and 6. Due to the changes of establishments from one industry to another figures for 1949 are not comparable with previous years. Exclusive of fish processing.

Consumption of Manufactured Products. - One of the beneficial results of adopting the same classification for external trade and for production is exhibited in Table 6, where the value of commodities made available for consumption in Canada is derived from these statistics. For example, the value of all manufactured commodities made available in 1954 was \$17,982,489,225, a figure obtained by adding to the value of manufactured products the value of the imports of manufactured and partly manufactured goods and deducting the value of the exports. In this table more accurate statistics could be presented were it possible to exclude from the gross value of manufactured products the duplications involved when the products of one manufacturing establishment become the material worked upon in another. Iron, vegetable, wood and paper, non-ferrous metals, animal and textiles were, in that order, the leading groups in the value of finished products made available for consumption in 1954.

Animal, wood and paper, and non-ferrous metal products were manufactured in Canada in greater quantities than required for home consumption, providing export balances in these groups.

On balance, Canada in the past imported large quantities of iron and steel, textiles, chemicals and non-metallic mineral products in spite of large home production. The expansion of the iron and steel, chemical and non-metallic mineral products industries will enable Canada to meet more of her requirements for home consumption and to export greater quantities in the future.

Significant changes have taken place since 1939 in the type of manufactured products made available for consumption. In that year, the iron and its products group was in leading position and contributed 19.8 per cent of the total value of manufactured products. In 1954 this group was still in first place, but the percentage went up to 26.0. The wood and paper products, non-ferrous metals, non-metallic minerals and miscellaneous industries groups also increased their share of the total, while chemicals and allied products remained unchanged. The three mineral groups, combined, increased substantially their share of the total from 35.9 in 1939 to 45.5 in 1954. This indicates a higher standard of living for the Canadian people and also reflects the great expansion and diversification in manufacturing which has taken place since 1939. The industries producing consumer goods, on the other hand, suffered a relative decline. Vegetable products dropped from 19.6 to 14.6, animal products from 11.8 to 9.7 and textiles from 13.3 to 9.0. The following table gives the relative position of the major industrial groups in 1939 and 1954.

Manufactured Products Made Available for Comsumption

(Percentage of the Total)

		, ,			
Group	1939	1954	Group	1939	1954
Vegetable products	19.6	14.6	Non-ferrous metal products	8. 9	10.5
Animal products	11.8	9.7	Non-metallic mineral products	7. 2	9. 0
Textiles and textile products	13.3	9.0	Chemicals and allied products	5.3	5. 2
Wood and paper products	11.6	12.6	Miscellaneous industries	2. 5	3.4
Iron and its products	19.8	26.0	Total	100.0	100.0

TABLE 6. Consumption of Manufactured Products, 1928-53, and by Industrial Groups, 1954

Figures for the years 1928-38 are for the fiscal years ended Mar. 31 of the following years: for 1939-54 they are for the calendar year. Net

imports are total imports less foreign products re-exported.

2. Consumption figures for the major groups of the Standard Industrial Classification cannot be calculated as statistics of imports and exports are still compiled on the component material classification basis.

3. See footnote 5, table 1.

SECTION 2. VALUE AND VOLUME OF MANUFACTURED PRODUCTS

Value of Manufactured Products.—In the interpretation of manufacturing values over a number of years, variations in the level of prices must be borne in mind. In recent years, due to violent changes in prices, unadjusted value series, used in isolation, have become increasingly inadequate as indicators of economic trends. Of necessity, interest has shifted to measures of volume. The range of prices since 1917, on the base period 1935-39 = 100, was as follows:

Year	General Wholesale	Fully or Chiefly Manufactured Products
917	148. 9	150.9
	203.2	208, 2
	124, 6	123, 7
	87. 4	93, 3
	99, 2	101, 9
	198, 3	199, 2
	220.7	228, 8
	217.0	224. 2
917 920 929 933 939 949 953 954	203. 2 124. 6 87. 4 99. 2 198. 3 220. 7	150. 9 208. 2 123. 7 93. 3 101. 9 199. 2 228. 8

Volume of Manufactured Products.—Since real income is ultimately measured in goods and services, the growth of the volume of manufacturing production, as distinguished from its value, becomes a matter of great significance. The important thing to know is whether consumers are getting more goods and services, and not whether they are expending more dollars and cents. The field of industrial production, because of its dominating position in the national economy, has attracted increasing attention. This, in turn, has resulted in the need for more accurate measurements of physical output.

During the past few years, the Business Statistics Section of the Bureau's Research and Development Division has been engaged in the reconstruction of the Index of Industrial Production. The project consisted mainly of establishing annual gross and net levels of production for each industry from census of industry data and of improving the reliability of the current monthly series. For a description of the methods used in constructing the indexes and a description of its scope, see D.B.S. Reference Paper No. 34 "Revised Index of Industrial Production, 1935-1951"

The construction of this index was made possible by the availability of a great deal of basic data. Annual statistics valuable for this project have been collected by the Bureau without interruption from the end of the first World War to the present, and the scope of the monthly information has been greatly expanded. Applying the methods developed through the experience of the last quarter century, it has been possible to compute an index with a fair measure of accuracy from 1935 to the present.

Prior to the end of the first World War, the movement of industrial production was regarded as following the output of a few factors such as pig iron. The introduction of the index number placed the information on a much wider base. It is safer to base one's impression of the current trend upon a comprehensive index embracing a wide range of economic factors than upon any limited group of components that necessarily fluctuate according to particular influences.

An index of this kind offers considerable advantage in analyzing social and economic problems. The greatest call for the index is for the interpretation of current economic conditions. It is particularly relevant in the study of business fluctuations. While the index is based on the sectors of the economy that are particularly sensitive to short term influences, it also reflects a large part of the variations in the total of all economic activity. The output of mines and factories plays a dominant part in economic fluctuations and is closely associated with transport and trade which are mainly concerned with the distribution of commodities. The barometric nature of the industrial sector enhances the value of the index as an indicator of short-term movements but its usefulness in the interpretation of long-term economic developments should not be overlooked.

The Canadian annual Census of Industry, from which final benchmark indexes are computed, covers practically all establishments, but excludes work in the home. In the matter of repairs, the census of manufactures generally excludes work performed in connection with a service trade such as boot and shoe and automobile repairs. However, the census covers repairs carried on essentially under industrial conditions, such as ship and locomotive repairs. Consequently only industrial-type repairs are included in the index.

The framework of the revised index is based on the new Standard Classification of Industries prepared by an interdepartmental working committee. The preceding system used by the Bureau of Statistics was of a three-fold nature based on (1) chief component material; (2) purpose and (3) origin. The first principle was used most extensively, the criteria of purpose and origin having been used for the presentation of supplementary series which played a secondary role in Bureau publications.

The main innovation introduced in the Standard Classification was the compromise between the different principles. In recent years, Canada's industrial system has undergone considerable development, from a country primarily concerned with the early stages in the processing of primary materials to one that is turning out more and more goods for final consumption. Consequently, in establishing the new classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. The purpose phase was regarded as most appropriate for the wide range of consumer goods such as clothing and foods and beverages.

The industries grouped under the component material phase of the classification from 1935 to 1948 were re-arranged to conform with the standard model. As most of the industries were not greatly affected by the change in classification they were transferred intact to the proper position in the new system. The standard classification, for the most part, provided for comparability at the industry level. It was applied to establishments for the first time in the 1949 census of manufactures. In a number of industries, where the change in classification seriously disturbed the continuity, establishments were re-combined for the whole period covered by the index. The manufacture of synthetic rubber, for example, was transferred from the rubber industry to "miscellaneous chemicals" Plants engaged in the production for distribution of manufactured gas were transferred from "coke and gas" to the gas and electricity division. The salt industry was adjusted so as to comprise only processing operations for inclusion in the manufacturing division of the index. Three minor industries which were reclassified to non-industrial groups were dropped from the computation.

The appropriate series in the manufacturing division were re-classified to obtain sub-indexes of economic significance. The movement of durable goods normally varies from that of non-durables. There tends to be greater fluctuation in durables from prosperity to depression, the demand for non-durables being more constant. The manufacturing division was therefore divided, at the major group level, as between durable manufactures and non-durable manufactures. Although these groupings are rather rough and ready, they are of great use in economicanalysis. The classification into producers' and consumers' goods, attempted in some countries, involves more difficulty as many intermediate commodities have alternate uses, and was not attempted here.

Volume of Production, 1923-35.—The indexes of volume of production, 1923-1935 given in Table 7 below were constructed in the General Manufactures Section of the Industry and Merchandising Division for the years 1923 to 1946. On comparing the index for 1935 given in Table 7 which stood at 87.9 with the new index for 1935 at 86.5 given in Table 8, it would appear that for the back years little significant variation existed between the two series. The indexes in Table 7 may therefore be used in evaluating the changes in the volume of manufacturing production between 1923 and 1935.

The physical volume of manufacturing production increased 50 p.c. from 1923 to 1929, When it is recalled that the population of Canada is estimated to have increased only 11 p.c. during the same period, the growth of manufacturing production is indeed remarkable. Of this advance, the part resulting from an increase in the domestic demand due to growth of population would therefore be about 11 p.c. Exports of partly and fully manufactured goods increased from \$591,830,000 in the fiscal year ended Mar. 31, 1924, to \$686.876,000 in the fiscal

year 1929-30, the increase in exports representing about 3.6 p.c. of the 1923 production. The remainder of the increase in production by 1929, or a margin equal to roughly 35 p.c. of the volume of manufactures of 1923, was, therefore, apparently absorbed by increases in capital equipment and by the rise in the standard of living of the population of Canada, From a high of 101.4 in 1929 the volume of production declined to 67.6 in 1932 and climbed again to 87.9 in 1935,

TABLE 7. Indexes of the Volume of Manufacturing Production, According to the Component Material Classification, 1923-35 (1935-39 = 100)

Year	Vegetable	Animal	Textiles	Wood and paper	Iron	Non- ferrous metal	Non- metallic mineral	Chemicals	Miscel- laneous	All industries

Volume of Production, 1935-1954.—The period covered by this report was characterized by unprecedented industrial expansion. Emerging from a depression practically world-wide in scope, industrial operations in this country entered a period of rapid growth which was maintained throughout the war and post-war years without important interruption.

A problem confronting business economists is to determine how much of the post-war industrial "drive" was due to normal growth factors and how much of it was caused by the backlog of war accumulated demand. While it is true that the greatest demand accumulation took place in housing and consumer durables, non-durables such as textiles and clothing also started the post-war period with a sizeable backlog of unfilled demand. It is now becoming apparent, after the vigorous pace of business following the outbreak of hostilities in Korea, that a considerable portion of this demand has been satisfied and some industries, notably textiles, clothing, agricultural implements and some major appliances, are experiencing difficulties. However, overall prospects appear bright for the near future. The increased productive activity which will result from the present very high level of capital investment is not as yet fully reflected in current production statistics. Huge expansion and development programmes are well under way in iron ore, aluminum and other metals, oil, chemicals, electric power, and in a number of other industries. In addition, federal government expenditures for national defence should still exert some influence on the economic picture,

The volume of output of manufactures rose steeply after the outbreak of hostilities in 1939. Productive facilities responded quickly to the urgent requirements of the armed forces. In the early days of the war, production assignments alloted were comparatively simple, but as the pre-war weapons became obsolete and as Canada proved herself capable of turning out larger and more complex equipment, the assignments constantly shifted, changed and grew more difficult. The production figures merely suggest the magnitude of the achievement. They cannot describe the tremendous effort needed to convert a semi-agricultural country into a wartime arsenal nor the complications which arose because of shortages of manpower, tools and materials.

The productive peak was reached in 1944, when weapons, supplies and equipment were rolling off the assembly lines at record-breaking pace. The end of hostilities and the subsequent reconversion to peace-time production were attended with declines in output in 1945 and 1946. The upward trend was resumed, however, in 1947. The rate of advance slackened moderately in 1948 and 1949 but regained most of its 1947 impetus in 1950 when the renewal of hostilities in Korea resulted in heavy anticipatory buying on the part of consumers and in growing expenditures for national defence. A remarkable feature is that in 1952, the index of the volume of manufacturing production which stood at 246,3 had surpassed the record wartime level of 242,3 established in 1944. The index continued to advance in 1953, reaching a record high of 263,0, In 1954 there was a minor recession and the index dropped to 251.4.

TABLE 8. Indexes of the Total Volume of Manufactureng Production, Classified on the Basis of Durable and Non-Durable Goods, 1935-1954 (1935-39 = 100)

Non-durable Manufactures

The trend of output in the non-durable sector of manufacturing was visibly smoother than in the durable sector. Except for three years, 1938, 1945 and 1954, there has been no interruption in the upward movement of production during the period under review. Despite the fact that war contracts quickened the pace of output in some of the industries, production continued to expand after the war, although at a slower rate. Unlike durable goods, non-durable commodities are mostly consumers' goods and are less influenced by sudden changes in the international situation or the capital investment programmes of producers and governments. By 1953 the non-durables index of output had reached 224,1, the highest on record. It dropped somewhat in 1954 to 221,7.

The production of processed foods and beverages rose without pause throughout the period. A characteristic of most manufactured foods industries is the high ratio of the value of materials consumed to the value of products, indicating a relatively low degree of fabrication per unit of output. The advance in the production of beverages was practically uninterrupted from 1935 to the present. In 1954, the volume of output was more than 3 times what it was in the base period. The largest increases were recorded in the aerated waters and brewing industries. The indexes of these industries attained levels approaching 352 and 355 in 1954: Wine production, after reaching a peak in 1947, dropped 36 per cent in the following three years. Some recovery was recorded during the next few years and in 1954 the output of new wine was 91 p.c. of the 1947 peak. Output of liquor climbed steadily until 1946 when the index reached 209. During the next four years, the volume of production fluctuated within narrow limits and in 1952 advanced sharply to an index level of 260, with a further rise to 290 in 1953 and a decline to 282 in 1954.

The great demand for cigarettes for members of the armed forces during the war contributed largely to the considerable increase in the tobacco products index Which reached the record level of 230 in 1945. The index dropped to 204 the following year, but rose gradually thereafter to 228 in 1950. Weakening demand led to a decline of 7 per cent in 1951. Rapid recovery was made during the next three years with the index rising to 279.3 in 1954, highest on record.

The contribution of the "Rubber Products" industry to the war effort was mainly in the form of tires and tubes for military vehicles and aircraft. Production of passenger car tires and tubes was sharply curtailed as was the output of rubber footwear. After marked increases in 1940 and 1941, the index remained more or less stationary at around 150 until 1945 when civilian production was resumed and the index jumped to 180. The industry-wide strike in 1946 contributed to a decline in that year, but record-breaking demand for the industry's output led to sharp advances in the following years, and in 1951 the index had reached the maximum level of 264, During the next few years the index fluctuated and in 1954 levelled off to 253,

Output of leather products rose steadily until 1946 when the index reached a high point of 168. The subsequent easing of foreign demand for the industry's products contributed to the gradual decline of production in the post-war period with the result that this group has shown the smallest growth of any in the manufacturing sector. In 1954, volume of output was only 29 per cent greater than in the base period. Production of leather tanneries was actually 4.0 p.c. lower than in 1935-39, while the output of boots and shoes was 48 per cent higher. Since 1946 the overall index dropped 23 per cent.

The textile (ex. clothing) industries reached their maximum wartime level of output in 1942 when the net index stood at 187. Production then fell off gradually until 1946 but recovered sharply in the post-war period to an index level of 212 in 1950. A slackening of demand for textile products in the latter half of 1951 resulted in a moderate decline in the index for that year with a further drop to 184 in 1952 and a slight improvement to 188 in 1953. In 1954 there was a sharp decline in volume, the index dropping to 161, the lowest since 1945. Of all the industries of the non-durable goods sector, textiles were the hardest hit by the downturn in manufacturing activity in 1954. The movement of individual industries within the group have varied over the period. After reaching its highest level in 1942.

the production of cotton goods declined steadily until 1947. After varying but fractionally in 1948 and 1949, output jumped 16 per cent in 1950, and remained practically unchanged in 1951, the recession in the last six months of the year just about offsetting the gains recorded in the first half. With continuing adverse conditions, the index dropped to a post-war low at 115 in 1954. Contributing to the higher level of net output during the period 1940-1943 in this industry was the comparatively sharp increase in production of piece-dyed and printed and painted fabrics which require considerably more processing than ordinary grey fabrics. When output of these two types of cloth declined to more normal levels, the change was reflected in the annual indexes.

Since 1938, the production index for synthetic textiles showed an unbroken record of increases and in 1951 stood at 393. The adverse conditions prevailing in the textile industry generally during the past few years also affected the output of synthetic textiles. By 1954 the index dropped to 290. Much of the credit for increasing consumer acceptance of synthetics belongs to the achievements of research in improving manufacturing and dyeing techniques and in the development of new combinations of various fibres with a new range of qualities and practical applications,

Synthetic fibres are now being used in the fabrication of a host of commodities such as suitings, overcoatings, blankets, carpets, draperies, upholstery products, tire fabrics, etc., in addition to hosiery, dress fabrics and other women's wear. Moreover, Canadian producers are now supplying the bulk of domestic synthetic raw material requirements which were formerly imported from the United States. As a result, new investment outlays by the industry have increased considerably in the post-war period.

The trend in the physical output of clothing was similar to that of other textiles, the production index reaching a peak of 162 in 1942, then declining gradually until 1945. Since then, output fluctuated within narrow limits, rising to a post-war high of 159 in 1949, a low of 150 in 1951 and with a further rise to 154 in 1952. In 1953 the index rose sharply to 167, which is an all-time high, but declined again to 145 in 1954. The industry is now facing keen competition and a more selective retail demand. By improving manufacturing methods and styling, the industry hopes to make available more desirable merchandise at lower prices. Weak demand contributed to a marked decline in the level of new investment in durable physical assets, Funds expended for new plant, machinery and equipment dropped from \$15.7 million in 1949 to an average of \$12.4 million during the past five years.

Production of paper products advanced sharply in the postwar period. The level of the index remained relatively steady from 1941 to 1944, but increased 54 per cent in the succeeding seven years to a record figure of 248, In 1952 the index dropped to 236 and increased to 254 in 1954, Activity in this sector of manufacturing is influenced mainly by the "Pulp and Paper" industry, which, in terms of value added, is the most important single manufacturing industry. In the last few years, the net value contributed by pulp and paper mills was more than twice that of any other industry. The growth of this industry during the period under review was characterized by two distinct phases. From 1935 to the end of the war, new investment by the industry was designed mainly to replace worn-out machinery and equipment and increases in output were principally the result of utilizing idle capacity after the depression of the thirties. Since 1945, however, with strong world demand for wood pulp and newsprint, together with the availability of necessary materials for expansion, the construction of new plant and the installation of new machinery and equipment reached record proportions. Investment in new plant and equipment, which averaged \$105 million during the previous three years dropped to \$69 million in 1954, a decrease of \$47 million from the record high reported in 1952.

Newsprint, pulp and paper board are the leading products of the pulp and paper industry. Production of newsprint in 1954 totalled 6,000,895 tons of which 5,521,530 tons were exported. Canada is thus the leading exporter of newsprint in the world. World exports of newsprint in 1953 are estimated at 6,481,000 tons, with Canada accounting for 82.9 p.c. of the total. Finland,

Sweden and Norway, in the order named, are other substantial exporters of newsprint and between them have accounted for 12.5 p.c. of the total. Newsprint is also Canada's leading export and in 1954 was valued at \$636,600,000.

The printing and publishing industries expanded very little during the war years. In 1944, output was only about 15 per cent greater than in the base period. Production grew rapidly, however, after the end of hostilities and in 1954, volume of output was more than double what it was in the five pre-war years, although this represents a substantially smaller advance than total manufacturing. The post-war increase coincided with the gain in the value of new investment which was mainly in the form of machinery and equipment to make up for deficiencies dating back to the depressed thirties and the war years. Investment in fixed assets totalled \$16 million in 1953 and \$31 million in 1954 as compared with only about \$2 million in 1944,

With few interruptions, output of petroleum and coal products rose steadily over the period under review to an index of 337 in 1954. Although production of coke failed to exceed its record wartime volume, petroleum refining, as the result of record-breaking post-war demand for gasoline and fuel oils. showed a marked expansion, In 1954, the production index stood at 418 compared with a wartime high of 170 in 1944. In recent years, the industry has added substantially to its refining capacity, From 1947 to 1951, expenditures for new plant, machinery and equipment which averaged more than \$37 million a year rose to \$84 million during 1952, 1953 and 1954. Some of this rapid growth is associated with the remarkable progress made in the exploitation of western crude oil reserves. In 1954. oil from domestic wells represented 55 per cent of the total consumed by Canadian refineries. This compared with a contribution of 22 per cent in 1949.

Output of chemical products which include ammunition and explosives reached a record-high level in 1944 when the index stood at 390, Production in the post-war period has been at a considerably lower level, but increased significantly since 1950, with the advent of the defence programme. The expansion of the industry during the war made possible the manufacture of many products which were formerly imported. In addition, several entirely new products, such as synthetic rubber, were introduced. Demand for these commodities continued in the post-war period and the development of new sources of basic materials, together with the progress of research into additional commercial uses for these new compounds resulted in further expansion of production for civilian use.

The rapid wartime advance was mainly the result of the enlargement of the munition programme with the government and private industry combining forces in the construction of a huge explosives and ammunition-filling industry. At its peak in 1943, the production index for explosives and ammunition was 20 times higher than in the base period, Output dropped very rapidly after the end of the war and in 1946 the index was down to 107.

Since the Government-owned Polymer Corporation began producing synthetic rubber in 1943, output of this important commodity has expanded considerably, to a total of 98,000 tons in 1954. Production declined somewhat in 1947 and 1948 when imports of natural rubber were resumed, but recovered strongly to record levels since 1950, as the defence programme gathered momentum and as the rubber requirements of the motor vehicles industry rose to a new maximum, During 1954, synthetic rubber accounted for 41 per cent of total new rubber consumed in Canada. This commodity is classified to the "Miscellaneous Chemicals" industry.

Durable Manufactures

The tremendous increase in physical output during the war years was mostly concentrated in the durable goods sector. When war was declared in September, 1939, there were virtually no armament works, no production of large ships and large planes, no guns, no tanks. Within a few years Canadian plants were turning out naval and merchant ships, warplanes ranging up to the 15-ton Lancaster bomber, millitary vehicles, millions of rounds of ammunition and hundreds of other war items. On the base of 1935-39 the new volume index of durable manufactures reached a peak of 340 in 1944. In the following two years it declined sharply and stood at 205 in 1946. Since then it has almost regained the lost ground, and reached 298 in 1954.

The largest gain occurred in the output of transportation equipment. Due principally to the tremendous increases in

production of ships and aircraft, the index for this group of industries rose to the record level of 694 in 1944, the year of maximum war production. After reaching a post-war low of 222 in 1946, the index rose moderately during the next three years, but, spurred by the great demand for passenger cars and by the renewal of defence production, marked gains were made since 1950, with the index climbing to 436 in 1953. The minor recession in industrial production in 1954 affected this group more than any other. The index dropped to 355, a decline of 18,7 p.c. as compared with the previous year.

The iron and steel group of industries was also considerably affected by war requirements. As most of the industries in this sector were more firmly established in the pre-war period, they did not expand relatively to the same extent as shipbuilding and aircraft. When European supplies were cut off

early in the war, the Canadian basic steel industry had to rely on the United States for a greater supply and had to increase its own steel-making capacity to meet abnormal wartime requirements. However, development of the industry did not halt with end of hostilities. Canada's industrialization programme, together with strong post-war demand for consumers' durable goods, led to steady expansion of the industry so that by 1953, the index for the group stood at 291. Compared with pre-war, pig iron output had more than tripled, and steel ingot and casting production had risen by 170 and 74 per cent respectively. Due to the contraction in the demand for durable goods in 1954 the index for the group dropped to 252, down to about the 1947 level. Pig iron at 2,211,000 tons was down 27 p.c. and steel ingots at 3,195,000 were 22 p.c. lower. The additional capacity constructed during the past few years should reduce still further the country's dependence on United States imports of finished and semi-finished iron and steel shapes. Indicative of the rapid growth of the industry in recent years is the amount of funds expended for new plant, machinery and equipment, From an average annual expendition of \$62 million during the previous five years new investment jumped to \$136 million in 1952 and \$114 million in 1953, In 1954 new investment amounted to \$88 million.

To meet the need for electrical and radar equipment and signalling devices. The "Electrical Apparatus and Supplies" industry manufactured articles during the war which were previously not made in Canada. Output of civilian radio receiving sets and appliances was severely curtailed as the industry converted the major part of its productive capacity to the manufacture of war instruments. The production index reached a wartime peak of 312 in 1944 and declined during the next two years. The industry recovered rapidly, however, as a result of accumulated demand for radios, consumers' appliances and heavy electrical equipment, and by 1952 the index had jumped 60 per cent from its 1946 post-war low, to a level of 393. Due mainly to the heavy demand for television sets, the index in 1953 advanced sharply to 487 an increase of 24 per cent over the previous year. In 1954 the index declined moderately to 478.

Production in the non-ferrous metals group of industries reached a wartime maximum in 1943 when the net index stood at 285, During the next three years, output dropped 44 per cent, but recovered steadily thereafter, backed by sustained demand for base metals. Aluminum is being fabricated into an everincreasing variety of commodities, and production of aluminum

bars and rods, sheets, shapes, etc., reached record proportions in the post-war period. During the war years, aluminum sheet production was of a strong alloy type used principally in aircraft construction and required more fabrication than the regular type of sheet used in the production of cooking utensils and other civilian items. The index in 1954 stood at 247.

Military requirements did not affect the nature of output in the non-metallic mineral products group of industries. In war or peace, the bulk of production consists of construction materials such as cement, cement products, building brick, lime and gypsum products, glass, stone products, etc. During the war, under government control, a major proportion of these industries' products were channelled into construction of new war production plants, extensions to pre-war plants, housing for war workers and the building of training and operation facilities for the armed services. No serious reconversion problems were encountered by the non-metal industries immediately following the war. After a slight pause, following the peak of wartime output, plants turned their productive capacity towards meeting the unprecedented demands of the post-war construction boom. From a wartime maximum of 212 in 1943, the volume index dropped moderately in 1944 and 1945, but rose steeply in succeeding years to reach the record level of 410 in 1954. This was one of the few groups of the durable goods sector that continued to advance during 1954.

In the durables sector, the wood-using industries were the least affected by the war. The volume of output of wood products expanded steadily without any serious interruption throughout the war and post-war years. In 1953 the index stood at 235, the highest on record. In 1954 the index declined fractionally to 230. The two most important industries are "Sawmills" and "Furniture". The index representing the former, after reaching a wartime maximum of 140 in 1942, declined considerably in 1943, and hovered around 124 during the next two years. Beginning in 1946, output rose sharply, spurred by strong foreign and domestic demand for sawn lumber and by 1951, the index had advanced to 168, but declined to 164 in 1952. Some improvement took place in 1953 and 1954 with the index advancing to 177. Production in the furniture industry expanded throughout the period under review. The great increase in residential construction in the post-war period, together with the marked gain in new family formations created a boom for producers of house furnishings. Output of furniture jumped sharply in the three years immediately following the end of the war and rose more gradually during the subsequent period.

SECTION 3. PRODUCTION BY INDUSTRIAL GROUPS AND INDIVIDUAL INDUSTRIES

Subsection 1. Manufactures Grouped on the Standard Classification Basis

Three important changes have been made during the past few years in the methods of collecting and compiling the returns of the annual survey of manufactures. First was the adoption in 1949 of the Standard Industrial Classification, This new classification superseded the classification formerly used by the Bureau, which was based on the nature of the materials used by manufacturing establishments.

For most purposes, a classification of manufacturing industries based upon "chief component material" has in the past proved most useful in Canadian industrial classification. The Bureau's classification based on this concept has been the one most widely adopted for general purposes, such as the decennial census, foreign trade, industrial statistics, etc. Even for these purposes some modification has been deemed expedient, such as the inclusion of such a group as "Textile Products" comprised partly of animal and partly of vegetable products.

When the industry of a country is primarily concerned with the early stages in the processing of primary materials, which form final products such as pig iron, lumber or processed fish, a classification based upon chief component material is wholly applicable. As manufacturing industry develops, however, turning out more and more goods for final consumption, the combination of ingredients in such production becomes more and more complex. The modern automotive, aircraft, shipbuilding and electrical apparatus industries are examples in which a wide variety of materials must be assembled for the compilation of the final product. For this reason, the application of the component material classification became increasingly more difficult as Canadian manufacturing production developed and diversified.

In establishing the Standard Industrial Classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. For the classification of consumers' goods industries, the concept of "purpose" seems most applicable both in terms of common usage in referring to industries and in providing the type of data most often required. Hence, such major groups as Foods and Beverages, Clothing, Transportation Equipment, Electrical Apparatus and Supplies, have been established. Some industries were broken down, such as the electrical apparatus and supplies which now comprises five industries—(a) batteries, (b) heavy electrical machinery, (c) radios, television sets and parts, (d) refrigerators, vacuum cleaners and appliances, and (e) miscellaneous electrical products. In some cases, establishments were transferred from one industry to another in order to bring them in line with the new industries which were established. Where an industry was eliminated, the establishments were transferred to one or several industries, depending on the nature of the principal products manufactured. A check was also made of all establishments and many transfers were made where the major products of the establishment had changed materially during the years. By and large, little change was required for most industries, the only change being a transfer to the new major groups which were established.

In the Standard Classification adopted in 1949 the industries are now grouped into seventeen major groups listed in Table 11, instead of the nine groups listed in Table 13 which were formerly used as the main basis of classification. The grouping used in Table 11, where the statistics of individual industries are presented in detail, and in the historical series shown in Table 3 is, therefore, on the basis of the new Standard Industrial Classification, However, to retain some basis of continuity with the past, there is a less detailed analysis given in Table 13 or the component material classification basis, while Table 14 gives the industries on the basis of the origin of the materials used.

The second major change was the adoption of the short form in 1949, which goes a long way in relieving small manufacturers from the irksome duty of filling in complicated and detailed returns to the Bureau.

The growing complexity of modern economic life compels governments to obtain more and more data on which to base their economic policies and for the efficient discharge of their responsibilities in the ever-widening field of activity. To get this information is expensive and also throws a burden on industry in general, which of necessity must be called upon to furnish the desired data. Realizing this, and also the fact that the necessary information must be secured, the Bureau has been casting about for new statistical techniques which would lessen the burden on industry and also would, at the same time, secure substantially correct data for the use of the administrator. With manufacturing statistics, unfortunately, the sampling techniques are difficult to apply. Other methods, therefore, had to be adopted in order to lessen the burden of the smaller manufacturer at least and, at the same time, secure substantially correct results. It was found, for example, that in 1949 out of 35,792 manufacturing establishments, 21,060 with a value of production of \$50,000 or less, contributed only 2,6 p.c. of the total value of production. On the surface it looked obvious that the Bureau could exempt these 21,000 establishments from making annual returns and still obtain satisfactory results. This would be true if we were only interested in the total value of production or the total value of materials used. This, however, is not the case, as the users of the statistics are also interested in the details of the products made and the materials used. By a study of each industry it was found that by exempting the smaller establishments in some industries, that for some commodities produced or materials used there would be a 50 p.c. loss of the total. Complete exemption was therefore out of the question. New methods had to be designed to relieve small establishments of the difficult task in furnishing information, A study was therefore made of each industry classification, of which there are about 200, and different cutoff points were determined for different industries. The general rule adopted was that wherever possible establishments with a value of production of less than \$50.000 per annum should only be required to furnish that one figure to the Bureau, and that on the basis of the information received from the smaller establishments in 1948, the last year for which they were required to furnish complete details, the Bureau would estimate for each small establishment individually the number of employees, salaries and wages paid, as well as the value of materials used. This is done in order to have a hollerith card for each establishment to use in the compilations on a geographical basis. In addition to the principal statistics, details of materials used and products made by the short-form firms are also made for each industry, by province. These estimates are based on the detailed statistics supplied by the small establishments in 1948. These estimates cannot be far out, as in most industries the percentage that these smaller establishments contribute to the total for the industry is only from 10 to 20 p.c. Where it was found that there would be a great loss in commodity data, instead of asking only for the gross value of production, the smaller firms were required to fill in a shorter form which lists the commodities in which there would be a substantial loss if no information was obtained from small firms. In other cases the cut-off point was reduced to \$25,000 or \$15,000.

An important change was made in the annual census of manufactures for 1952. A shipments concept instead of the value of production statistics heretofore compiled was adopted for a large number of industries where it was known that inventory changes from year to year were only of a minor nature. The concept was not changed for industries known to experience wide fluctuations in inventory holdings, pending further study for the need of both production and shipments information. By 1954 the shipments concept was implemented for almost all industries, Industries for which production statistics are still

required are asked to report the detail of products made in physical quantities only and at the same time are required to report details of their shipments, giving both the quantity as well as the selling values at the plant. In a few industries such as sawmills, veneer and plywood, etc., production statistics only are still collected, the products made being valued on the basis of average selling prices during the current year.

The aim of the new Census of Industry schedule is to ease the burden of filling out Bureau questionnaires. The value of shipments concept for small and medium sized establishments is more realistic and more readily obtainable from the accounting records of firms, whereas the value of products made, for firms not recording such information, must be derived from special calculations. The value of shipments provides a standard basis of reporting for all establishments. Under the old system some establishments reported the value of products made and others the value of factory shipments, even though the schedule required products made to be reported. This was especially true for small and medium sized establishments. Further, a great number of firms, attempting to report production values to fulfil the requirements of the old questionnaire, in fact computed their cost of production rather than their selling value, as they were supposed to. Since the value of shipments is usually carried in the firm's accounts, the work of filling out reports should be lessened and the questionnaire should as a result be filled out more promptly. The change should ease the burden for small establishments in particular, since the value of sales is readily available from their accounting records.

Under the "value of products" concept, establishments were required to report the factory selling value of the products made, whether sold or not, the unsold portion being assigned the average selling value of similar articles sold during the year. Where no selling values were available for the unsold portion estimated values had to be assigned. Under the new concept establishments are required to report their sales during the year, regardless of when the products were made.

These two concepts give different results, the first gives the value of products made and the second the value of products sold. For a large number of industries where normally there is no significant changes in the opening and closing inventories of finished products, these two sets of figures may be used interchangeably as they both reveal more or less the value of production and are, therefore, comparable with figures for previous years. There are, however, a number of large key industries with substantial changes in their opening and closing inventories. In such industries the new concept gives quite different results to that obtained formerly. To get comparable figures, the shipments figures must be converted to a production basis by adjusting for inventory change.

The change to the new concept solved the problem of uniformity of reporting inasmuch as the smaller firms who previously were reporting shipments instead of production are now reporting correctly. However, the new method has created other problems. One of these is the calculation of "value added by manufacture," which is obtained by subtracting from the value of production the cost of materials used, including the cost of fuel and electricity. Since the value of production is not now being reported, it has to be calculated by using the following formula.

"Shipments plus closing inventory of finished products minus the opening inventory of finished products equals value of products made." In order to enable the Bureau to calculate "value added," it became necessary to ask firms to report their opening and closing inventories, broken down into (a) raw materials, (b) goods in process, and (c) finished products. These questions were added to the form for the 1954 census, As the schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added by manufacture is obtained by subtracting from the shipments the cost of materials used, including fuel and electricity.

In theory, adjustment should also be made for the change in work in process inventory, and ideally the inventory adjustment should be on a "value of the physical change" basis rather than the "change in book value." However, it has not been possible to introduce these refinements at the present time.

Another difficulty has arisen in implementing the shipments concept in the case of multiple unit firms that ship the products from the various plants to a central warehouse, located in another city, where the selling function of the firm is performed. In such cases the goods leaving the plant are considered as being shipments under our definition even though the ownership still remains with the reporting firm, Such firms are considered as performing two distinct functions - (a) manufacturing, and (b) distributing - and these two functions are treated statistically as if they were performed by two different organizations. In many cases no stock is held at the plant; consequently shipments and production reported on a plant basis are one and the same. We therefore are still getting production figures from firms that sell from a central warehouse. Where the manufactured products are billed to the warehouse, the firm is required to report the total of such billings during the year. In some cases the production and distribution functions are treated in the accounting records as a unified operation, no charge being made to the warehouse of the products shipped. In such cases firms are instructed, if possible, to report the shipments on a cost of production basis, with a percentage mark-up for profits. The aim of the Division is to get companies to report their shipments on the same basis as if they were selling to an independent wholesaler.

Having received a return from all manufacturing establishments and the value of their products totalled, the question now is "What does this total mean?" The truth of the matter is that a total value of production for a group of industries or all industries for a single year has no significant meaning. To add the value of production of flour mills to that of the baking industry would give an inflated value of production since part of the flour which was sold to bakeries is valued twice, first as a product of flour mills and again in the cost of bread. For example, if a flour mill would produce \$1.00 worth of flour and sell it to a baker, the baker would use this dollar's worth of flour, and after further processing would sell it for \$2,14 according to the experience of the baking industry for 1954, According to the statistics obtained for that year for every dollar's worth of materials used the products made were valued at \$2.14. When you add the production of these two establishments, you get a value of \$3.14. There is thus duplication where the products of one establishment become the raw materials of another establishment. However, in the present issue, the totals of gross value of production or shipments are shown as a matter of historical interest.

A more meaningful indicator had to be evolved to measure the importance and wealth created by an industry or group of industries. This was found in the concept "value added by manufacture." This figure is obtained by subtracting the cost of fuel and electricity as well as the cost of materials used from the gross value of the products, and represents the values added to the raw materials while they are in the factory. Such added values constitute the real production of the manufacturing plant and are alone available for the payment of salaries and wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met, as well as profits. The value added by manufacture reported by the various industries can be added to produce a non-duplicating total for manufacturing as a whole. Being free of duplication, within the manufacturing sector value added figures are therefore more representative of the total value of manufacturing production than the gross value of production figures.

The concept of "net value" is also important in evaluating the importance of an industry as a creator of economic wealth, Usually the gross value of production is used in ranking industries, This method has the defect of overevaluating industries that use expensive raw materials which undergo little processing. The following table ranks the fifteen leading industries in 1954 on the basis of "gross" and "net" value of production.

	Selling factory s	value of hipments	Value a manuf	dded by acture
	Amount	Rank	Amount	Rank
	\$'000,000		\$'000,000

Rubber goods (including footwear)	264, 2	14	149.0	10
Printing and publishing	256, 7	15	182. 9	6

In interpreting the statistics of individual industries, it should be remembered that the figures on employment, production, etc., do not refer to individual products but to all the products made in an industry. For example, the value of production of the confectionery industry, amounting to \$104,853,748 in 1950, does not imply that this was the value of confectionery produced. What it means is that the firms whose principal product is confectionery had a value of production of \$104,853,748. This figure, in addition to confectionery, includes all the subsidiary products made by these firms such as tice cream which was valued at \$2,214,689 and bread and other bakery products valued at \$2,457,312. Confectionery is also

produced as a subsidiary product by firms credited to other industrial classifications. For total production figures of individual products, reference should be made to "The Alphabetical List of Products" published annually as Appendix II to this report.

Table 11 presents for the year 1954 detailed statistics regarding the individual industries under which all industrial plants in Canada are classified. The industries are further assembled under seventeen main groups according to the Standard Industrial Classification.

Table 12 gives the amount and value of each of the principal commodities produced or shipped by the manufacturing industries of Canada, Commodities produced in small quantities

are not included but the list covers approximately 75 p.c. of total production. For a complete list of products, see Appendix II of this report.

TABLE 12. Quantities and Values of the Principal Commodities Produced or Shipped by the Manufacturing Industries of Canada, 1954

Note: Since 1952 the basis of collection is "Value of Factory Shipments" instead of "Gross Value of Products". However, the commodities marked* are still on a production basis.

marked are still on a production basis.			
	Unit of measure	Quantity	Value
			S
Food: Biscuits, all kinds Bread Butter, factory made Cheese, factory made	1b.	236, 902, 540 1, 525, 974, 000 316, 781, 734 153, 142, 290	66, 070, 322 173, 166, 427 184, 742, 536 49, 793, 305 75, 363, 925

^{1.} Includes excise taxes on prime cost of "Spirits" and "Tobacco Products".

Subsection 2. Manufactures Classified on the Chief Component Material Classification Basis

For the most purposes a classification of manufacturing industries based upon "chief component materials" has, in the past, proved most useful in Canadian industrial classification. For this reason the Bureau's classification based upon this concept has been the one most widely used for general purposes such as the Decennial Census, Vital Statistics, foreign Trade, etc. Even for these purposes some modification has been deemed expedient, such as the inclusion of a group "Textile Products", composed partly of animal and partly of vegetable products,

When the industry of a country is primarily concerned with the early stages in the processing of primary materials, i.e., when its final products are chiefly such items as pig iron, lumber and processed fish, a classification based upon chief component material is wholly applicable, As manufacturing industry develops, however, turning out more and more goods for final consumption, the combination of ingredients in such output becomes more and more complex. The modern automotive, aircraft, shipbuilding, and electrical apparatus industries are examples in which a wide variety of materials must be assembled for the completion of the final product.

In recent years Canada's industrial system has undergone considerable development. Consequently in establishing the Standard Industrial Classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. For the classification of consumers' goods industries the concept of "purpose" seems most applicable both in terms of common usage in referring to industries and in providing the type of data most often required. Hence, such major groups as Foods and Beverages, Clothing, Transportation Equipment, Electrical Apparatus and Supplies, have been established.

TABLE 13. Principal Statistics of the Manufacturing Industries, Classified on the Chief Component Material Classification Basis, by Main Groups, Significant Years, 1917-1954

Industrial group and year	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Gross value of products

1. In 1952 the basis of collection was changed from "value of products made" to "value of factory shipments"- See text on pages 8 and 23.

Subsection 3. Manufactures Classified by Origin of Materials

The distinction made between farm materials of Canadian and foreign origin is based on whether the materials are indigenous to Canada rather than on their actual source. Thus, the industries included in the foreign origin classes are those depending upon materials that cannot be grown in Canada, such as tea, coffee, spices, cane sugar, rice, rubber, cotton, etc. Industries included in the Canadian origin classes may, however, be using large quantities of imported materials.

The mineral origin group includes, in addition to nonferrous metals so largely produced in Canada, the manufactures of iron and steel, or petroleum, and of other mineral substances, the raw materials for which are very largely imported. Products of mineral origin, with the exception of fuels, are nearly all durable goods. A high standard of living and advanced industrial organization is usually indicated by a relatively large production and consumption of mineral products. During periods of depression when the production of capital goods is curtailed, employment in the industries of the farm group, which produce mainly consumer goods, exceeds that of the mineral group. The industries of the mineral group in 1943, at the maximum of the war effort, had by far the greatest capital investment, employed the largest number of persons, and paid out the highest amount in salaries and wages. In 1943 the average capital per employee amounted to \$5,441 for the mineral group as compared with \$4,417 for the farm origin group. The mineral group also pays the highest wages. In 1954 the average salary and wage was \$3,524 for the mineral group and \$2,623 for the farm origin group.

^{1.} For the year 1924 the figures for "Cost of Materials" and "Gross Value of Products" include the value placed on intermediate products used in further processes in the chemical group of industries. For this reason these figures differ slightly from those contained in the other tables of this report.

2. In 1952 the basis of collection was changed from "Value of Products Made" to "Value of Factory Shipments". See text on page 8 and 23.

Subsection 4. Manufactures Classified by Type of Ownership

This subsection deals with the type of ownership under which Canadian manufacturers operate, The first survey in 1946 did not include the fish-curing and packing industry, information for which was not available at that time. For this reason the figures for 1946 are not strictly comparable with those for succeeding years, although the inclusion of that industry has not materially altered the percentage distribution of individual ownership, incorporated companies, etc.

Of the 38,028 establishments operating in 1954, 1,383 establishments in the periodical publishing industry were unclassifiable, leaving 36,645 establishments in the four cate-

gories of ownership. Individual ownership numbered 15,992 establishments, partnerships 5,236, incorporated companies 14,471 and co-operatives 946. The percentage distribution of the four categories of ownership are given below for the years 1946 to 1954. It is interesting to note that incorporated companies are becoming increasingly important, the percentage of the total number of establishments having risen from 33,4 in 1946 to 39.5 in 1954, while the other three categories declined in importance. This trend to incorporation is no doubt accentuated by the favourable income tax rate allowed companies on the first \$20.000 of income.

Year	Individual ownership	Partnerships	Incorporated companies	Co-operatives
1946 (estinated)	47. 3 46. 4 46. 2 46. 0 45. 6	16. 0 16. 1 16. 4 15. 8 15. 0	33- 4 34- 3 34- 4 35- 3 36- 3	3. 3 3. 2 3. 0 2. 9 3. 1
1951 1952 1953 1954	44. 6 44. 9 44. 4 43. 6	15. 5 15. 4 14. 8	36. 9 36. 9 38. 2 39. 5	2- 8 2- 6 2- 6

As is to be expected, the smaller establishments, regardless of the type of products manufactured, are carried on under individual ownership. In that category industries conducted

on a small scale contain a large number of establishments, the percentage decreasing as the scale of operations increases, as the following statement shows.

No.	Group	Average number of employees per establishment	Percentage of individual ownership establishments to total
1	Wood products Printing, publishing and allied trades Foods and beverages Miscellaneous manufacturing industries Non-metallic mineral products Clothing (textile and fur) Leather products Chemicals and allied products Iron and steel products Textile products (except clothing) Knitting mills Non-ferrous metal products Paper products Electrical apparatus and supplies Products of petroleum and coal Tobacco and tobacco products Transportation equipment Rubber products 411 Groups	10. 6	61. 5
2		16. 2	44. 1
3		21. 9	47. 1
4		22. 8	33. 9
5		30. 4	32. 7
6		32. 8	27. 4
7		45. 7	27. 8
8		46. 2	16. 8
9		62. 0	24. 7
10		66. 2	29. 6
11		72. 8	14. 1
12		88. 1	25. 0
13		153. 6	8. 2
14		164. 3	8. 8
15		168. 8	1. 7
16		178. 7	35. 8
17		221. 6	28. 9
18		286. 2	9. 6

It is therefore found, according to the above, that in the wood products group 62 p.c. of the establishments were under individual ownership. The foods and beverage group had 47 p.c. of its establishments in this classification, followed by printing, publishing and allied trades with 44 p.c., tobacco and tobacco products 36 p.c., miscellaneous industries 34 p.c., non-metallic mineral products 33 p.c., textiles 39 p.c., ctansportation equipment 29 p.c., leather products 28 p.c., clothing 27 p.c., non-ferrous metal and iron and steel products 25 p.c. etc. The petroleum and coal products group with only 1.7 p.c. of the total had the smallest number of establishments operating under individual ownership.

The establishments operating under individual ownership are not as important, from the point of view of employment provided, as their large numbers would indicate. According to tables 15 and 16, these establishments which comprise 44 p.c. of the total have only 5 p.c. of the total employees. Partnerships accounted for 14 p.c. of the number of establishments

and 3 p.c. of the total employees. Incorporated companies with 39 p.c. of the number of establishments had 91 p.c. of the employees. Co-operatives with 3 p.c. of the establishments had 1 p.c. of the employees.

On the basis of employment provided, incorporated companies are, by a wide margin, the most important factor in the employment field. In the petroleum and 'coal products group practically 100 p.c. of the employees were reported by such companies, while the electrical apparatus and supplies, rubber, paper, and transportation equipment groups had 99 p.c. Companies in the chemical and the non-ferrous metal products groups had 98 p.c., tobacco and iron and steel products 96 p.c., textiles 95 p.c., knitting mills 93 p.c., non-metallic mineral products 92 p.c., leather products and miscellaneous industries 89 p.c., printing, publishing and allied trades 86 p.c., foods and beverages and clothing 82 p.c. Companies in the wood products group with 72 reported the lowest percentage of the total employment.

TABLE 15. Percentage Distribution of Establishments in the Manufacturing Industries, Classified by Type of Ownership, by Provinces and Industrial Groups, 1954

Province or group	Individual ownership	Partnerships	Incorporated companies	Co-opera- tives	Total

Subsection 5. Leading Manufacturing Industries

In the following statement, the rank of the ten leading industries in 1954, from the standpoint of gross value of pro-

duction, is compared with their respective ranks in significant years since 1922.

				Rank in			
Industry							
	1954	1949	1944	1939	1933	19 29	1922
Tulo and accord		4	5	2	1	1	2
Pulp and paper	1	3	0	1	2	9	
Non-ferrous metal smelting and refining		3	4	I.	4	· ·	1
Petroleum products	3	5	14	6	6	10	9
Slaughtering and meat packing	4	2	1	3	3	2	3
Motor vehicles	5	4	7	5	11	4	6
Sawmills	6	6	11	8	14	5	4
Butter and cheese	7	7	10	4	5	6	5
Primary iron and steel	8	8	13	11	31	16	20
Aircraft and parts	9	1	4	1	1	1	1
Miscellaneous food preparations	,10	20	26	1	1 .	1	1

^{1.} Did not rank among the forty leading industries that year.

A prominent feature of Canadian Manufacturing development during the past twenty-five years has been the rapid growth of non-ferrous metal smelting. This industry, based upon the rich base-metal resources of the country, has taken its place among the leading manufactures, along with the industries based upon forest, agricultural and live-stock resources. Another feature of this development in manufacturing production is the rise of the petroleum products industry from fourteenth place in 1944 to third place in 1954. This is the direct result of the recent discoveries and development of the large oil resources of the Prairie Provinces and the rapid industrialization of Canada during the past decade.

The incidence of the depression resulted in a re-arrangement of the ranking of many industries which in some cases has proved to be temporary. During the war, the industries engaged in producing the equipment needed by the armed forces, such as shipbuilding, aircraft, automobiles, miscellaneous chemical products, and primary iron and steel, advanced to higher positions. When the war ended, the industries engaged in the production of consumer goods, by reason of the expanded demand for their products, bettered their position. Pulp and paper, after a lapse of a number of years, resumed its premier position.

The impetus given to Canadian manufacturing production by the Korean war is reflected in the advance of the aircraft industry to ninth position. This industry which did not rank among the forty leading industries before World War II was in fourth place in 1944 and sixteenth place in 1952. The shipbuilding industry also bettered its position as a result of the current defence program. This industry which also did not rank among the forty leading industries in 1949 advanced to thirtyfourth place in 1952 and 1954.

Some major changes took place in the ranking of the ten leading industries in 1954. Due to the minor recession which occurred, a recession which affected the durable goods industries to a far greater extent than the industries producing nondurable goods, some significant changes were to be expected.

As a result of this, the industries classified in the durable goods sector lost ground as compared with the previous year. Motor vehicles dropped from third to fifth place, aircraft and parts from eighth to ninth place, and primary iron and steel from seventh to eighth place. On the other hand, petroleum products advanced from fifth to third place, butter and cheese from ninth to seventh place, and miscellaneous foods from thirteenth to tenth place, Pulp and paper retained its premier position. Three other industries retained their position in both years, These industries were: non-ferrous metal smelting and refining in second place, slaughtering and meat packing in fourth place and sawmills in sixth place.

TABLE 20. Principal Statistics of the Forty Leading Industries of Canada, Ranked According to Selling Value of Factory Shipments. 1954

SECTION 4. PRINCIPAL FACTORS IN MANUFACTURING PRODUCTION

The subjects treated under this Section include capital, employment, salaries and wages, size of establishments and power and fuel used in manufacturing.

Subsection 1. Capital and Repair Expenditures

Prior to 1944 the following information on capital investment was collected: Fixed Capital—Land, buildings, fixtures, machinery, tools and other equipment. Working Capital—(1) Inventory value of raw materials, stocks in process, fuel and miscellaneous supplies on hand; (2) Inventory value of finished products; (3) Cash, bills and accounts receivable, prepaid expenses, etc. This was replaced by the collection of statistics on the expenditure on fixed capital and repairs.

The remarkable increase in capital employed in Canadian manufactures from the beginning of the twentieth century has, of course, run parallel with the rapid growth in industrial operations. From 1900 to 1905 the capital increased from \$446,900,000 to \$333,900,000 and advanced to \$1,958,700,000 in 1915. During this period returns were received from establishments with 5 hands or over, and, while the rise in wholesale prices did not exceed 37 p.c., the capital employed in manufactures increased nearly 340 p.c.

Capital expenditures by manufacturers in 1954 totalled \$287,600,000 for construction and \$534,500,000 for machinery and equipment, while \$488,500,000 went for repairs. Of the total capital expenditures, amounting to \$822,100,000 in 1954, 14.1 p.c. was reported by foods and beverages, 12,7 p.c. by petroleum and coal products, 12,0 p.c. by iron and steel prod-

ucts, 11.8 p.c. by paper products, 8.8 p.c. by transportation equipment, 7.3 p.c. by non-ferrous metal products, 5.8 p.c. by non-metallic mineral products, 5.4 p.c. by chemicals and allied products, etc.

Of the groups reporting capital expenditures of \$25,000,000 or more in 1954, five reported increases and seven decreases, Of the groups reporting increases, foods and beverages with \$19,300,000 led the list, followed by printing, publishing and allied industries with \$15,000,000, products of petroleum and coal \$12,100,000, non-metallic mineral products \$10,900,000 and textiles \$600,000. The chemicals and allied products group with \$82,500,000 led the list of the groups reporting decreases in capital investment. This was followed by transportation equipment with \$32,200,000, non-ferrous metal products \$25,700,000, iron and steel products \$25,600,000, paper products \$16,800,000, electrical apparatus and supplies \$4,300,000 and wood products \$1,700,000.

Capital expenditures in 1954 declined by \$146,900,000. This compares with a decline of \$3,600,000 in 1953 and increases of \$180,000,000 in 1952 and \$290,100,000 in 1951. The following table gives the capital expenditures of the groups in 1954 reporting \$25,000,000 or more, together with the expenditures of these groups in 1953.

Variation in Capital Expenditures 1954 Compared with 1953

	1954	1953	Variation
		\$'000,000	
Foods and beverages Textile products Wood products Paper products Printing, publishing and allied industries Iron and steel products Transportation equipment Non-ferrous metal products Electrical apparatus and supplies Non-metallic mineral products Products of petroleum and coal Chemicals and allied products	104.3 28.5. 32.9 87.3 31.4 88.4 65.2 53.6 31.7 43.2 93.6 39.8	85.0 27.9 34.6 104.1 16.4 114.0 97.4 79.3 36.0 32.3 81.5 122.3	+ 19.3 + .6 - 1.7 - 16.8 + 15.0 - 25.6 - 32.2 - 25.7 - 4.3 + 10.9 + 12.1 - 82.5

Expenditures on capital assets which averaged \$812,000,000 during the past five years reflect the expansion and modernization which the manufacturing industries of Canada have experienced. Although the expansion was at a rapid rate, not all provinces, however, shared in this expansion at an equal rate. Newfoundland had relatively the highest capital expenditures of any province, the percentage of capital expenditures to the

value of factory shipments during the period 1950-54 being 11.1, more than double the Canada average, Alberta with 10.7 was in second place and British Columbia with 7.3 was in third place. Ontario and Saskatchewan equalled the Canada average of 4.9, while Prince Edward Island, Nova Scotla, New Brunswick, Quebec and Manitoba were below this figure.

Comparison of Capital Expenditures with Value of Factory Shipments, 1950-1954

	Per cent	of total

Subsection 2. Value of Manufacturing Inventory

As explained in the section on Capital Employed, the collection of statistics on capital investment by manufacturers was discontinued in 1944. This was replaced by the collection annually of expenditure statistics on fixed capital, repairs and maintenance from all large manufacturers, with estimates being made for the smaller establishments. As a result of this change mo information was available on investment in inventory. Before long, however, the need for this information became apparent. Consequently, beginning with 1949, calendar year-end inventory values have been collected from all manufacturing plants with an annual gross value of production of \$50,000 or over. These values are inflated to a total by estimating for small firms in each industry on the basis of the gross value-inventory ratio of reporting firms.

Commencing with 1954 questions on inventory were put back on the forms used in the annual survey of manufactures. As a result, all establishments with shipments of \$50,000 or more were required to give this information. As in the case of the calendar year-end series, estimates for establishments with shipments of under \$50,000 were made on the same basis. The results of the two series for 1954 are given in Table 25 below. It will be noted that these two series differ slightly. This is mainly due to the difference in time of reporting this information. In the first series the figures refer to the end of December while in the second they refer to the company year which in a number of cases might be anywhere from the end of January to the end of June. The figures in the first series are accordingly higher by 3.6 p.c. This is due to the desire of most companies to have

as low an inventory as possible at the end of their financial year. When the financial year is other than the calendar year they could and usually do report a higher figure for December than they do for the end of their financial year which is reported in the second series.

It should be noted that the calendar year-end values as shown in the table below are not strictly comparable with those published in previous general reviews on manufacturing, since the series previously published has been reduced by the entire value of inventories held but not owned, i.e. held under progress payments arrangements. The deduction was made from the goods in process component. In previous reviews an item of total inventory holdings was shown separately, but no attempt was made to assign it to any specific component. While the assumption that all such inventory is part of goods in process is not strictly true, it is nevertheless a fairly good working approximation.

Company year-end inventories in 1954 totalled \$3,212,259,750, of which amount \$1,592,511,471 was raw materials and supplies, \$608,641,448 goods in process and \$1,011,106,831 in finished goods. The foods and beverages group with 505.7 million dollars reported the highest inventory of any group. Iron and steel products with 475.5 millions came second, followed by paper products with 277.3 millions, wood products \$241.0 millions, transportation equipment 232.7 millions, chemicals and allied products 230.7 millions, electrical apparatus and supplies 208.6 millions, etc.

^{1.} Revised.

^{2.} Less than \$50,000.

Subsection 3. Employment in Manufacturing Industries

Monthly Record of Employment.—Ordinarily, manufacturing employment in Canada reaches its highest point during the summer months. Some of the seasonal industries, such as canning, are most active then, textile industries are preparing winter goods, and industry generally feels the active demand of the agricultural purchasing power resulting from the prospect of the season's harvest.

After the setback of 1929, employment in 1930, 1931, 1932 and the first half of 1933 declined steadily, the monthly employment figures in each case being lower than the corresponding month of the previous year. The peak of employment in June, 1929, when 575,693 production workers were on the payrolls, was surpassed in September, 1937, with 582,305 production workers. After the outbreak of war the improvement in employment became increasingly rapid. A record high was reached in August, 1943, when 1,067,890 production workers were employed, an increase of 96.4 p.c. over the same month in 1939. The highest employment during 1944 occurred in June when 1,049,557 production workers were employed. From then on employment declined steadily to the end of 1945 when 819,619 production workers were reported. At the end of 1951 there were

953,952 production workers employed, compared with an employment of 961,820 production workers in December, 1944, and 1,021,630 in December, 1943.

During the first half of 1952 the number of production workers increased each month, but not to the extent of the employment in the same month of the previous year. From the middle of the year monthly employment figures exceeded those of the previous year. This trend continued to October 1953. The trend for the next two months was downward so that by the end of 1953 there were only 990,611 production workers as compared with 1,018,764 at the end of December 1952.

The minor recession experienced in 1954 is reflected in the monthly employment figures, the number employed each month being lower than the corresponding month of the previous year, although there was the usual upturn during the summer months. Employment at the end of December at 932,786 was at the lowest level since 1949 when 906,851 persons were employed. December 1952 with 1,018,764 production workers had the highest year-end figures during this period.

Subsection 4. Hours Worked in Manufacturing Industries

Hours Worked by Production Workers, - From 1932, the first year for which figures on hours worked per week by production workers are available, to 1945, each firm was required to report the number of hours worked by all its production workers during the month in which the greatest number had been employed, the only exception being the years 1938 and 1939 when one week in a month of normal employment was reported. In 1938 the number of hours worked per week were compiled by sex, and a change was also made in the analysis of the weekly hours worked. Since 1940 the hours worked per week include overtime while prior to that overtime was excluded. These changes make it impossible to measure accurately the changes in the number of hours worked per week. In any case, the figures in Table 29 do not refer to any particular month, since the month of highest employment might be May for one firm and October for another; they represent the summation of the different months of highest employment as reported by all firms. For a given industry, however, the month of highest employment is more significant as in this case it coincides for a great number of firms engaged in the same industry.

For all production workers, the hours worked per week declined from 48,9 in 1932 to 47,2 in 1939, and reached 50,6 in 1941, some of the increase no doubt being due to the inclusion of overtime. Since then there was a counter movement in the hours worked, especially among females, due to the employment of many workers on a part-time basis. Whereas in 1939 there were only 2.8 p.c. of male and 5.3 p.c. of female production workers working under 30 hours per week, in 1944 these percentages rose to 5.3 and 12.5 respectively. Since the end of the war the normal working week has been dropping steadily. In 1945 average hours per week for male production workers totalled 47.6 and for females 42.7.

The method of collecting statistics on hours worked was changed in 1946. Instead of collecting this information for one week in the month of highest employment which varied from plant to plant, the last week of November was chosen for the base period. For 1948 and subsequent years the period was changed to the last week in October. The question on hours worked was taken out of the annual schedules used in connection with the census of manufactures and this information is now collected by the Employment Statistics Section, Establishments employing 15 hands or over only are covered. The statistics for 1946 to 1954 are, therefore, not exactly comparable with those for earlier years which include all establishments, both large and small.

On the above basis, the hours worked per week declined for all workers engaged in manufacturing. The hours of male production workers dropped from 44.9 in 1946 to 42.3 in 1954, female production workers from 40.0 to 38.5, male office employees from 42.0 to 39.0 and female office employees from 39.5 to 37.9.

Persons employed in 1950 and 1953 were classified on the basis of earnings per week instead of hours worked. For this reason the distribution of employees by hours worked per week is not available for these years. It is the intention in future to classify employees one year on the basis of hours worked, the second year on the basis of weekly earnings, while in the third year no break-down of either the hours worked or weekly earnings will be collected. Instead a more detailed break-down of salaried employees into (a) managerial and professional and (b) office workers will be requested.

Supervisory and office employees as a rule work shorter hours than production workers as the following figures for 1954

	Production Workers	Supervisory and Office Employees
Both sexes	41.5	39.0
Male	42, 3	39.4
Female	38, 5	37, 9

TABLE 29. Production Workers in Manufacturing, Working Specified Numbers of Hours per Week
in the Month of Highest Employment, 1938-45¹

rked per week in 1932-37 are given at p. 396 of the 1942 edition of the Canada Year Book; in 1940 at p. 386 of the 1943-44 edition

Note Hours worked ner week in 1932-37 are

Subsection 5. Earnings in Manufacturing Industries

In 1954, the 38,028 estat...shments covered, employed 278,936 supervisory and office employees and 989,030 production workers, a total of 1,267,966 persons. Out of every 1,000 persons employed in manufacturing, 220 were classed as office employees and 780 as production workers; the former earned 28 p.c. and the latter 72 p.c. of the total amount paid out as remuneration for services.

A notable feature during the past few years was the reduction in the disparity between average annual earnings of office and production workers. Whereas in 1939 average annual earnings of production workers were only 56 p.c. of that paid to office workers, in 1943 the percentage rose to 76, they declined to 69 in 1947 and rose to 74 in 1954. This tendency towards equalization was due, in part, to the controls adopted

by the Government during the war years which tended to stabillize earnings of office workers more so than the earnings of production workers. The increase in average earnings of production workers was also influenced by the fact that large numbers were employed in the highly paid iron and steel industries and by the increase in the number of hours worked, some at overtime pay.

Ontario has a larger proportion of females among its office employees than the other provinces. The same situation prevails in Quebec with regard to production workers, due, no doubt, to the textile industries of the Province. The importance of the textile industries in providing employment to females is strikingly illustrated by the fact that of all female production workers engaged in the manufacturing industries of Canada in 1955, 41 p.c. were found in the textile and clothing groups.

Average earnings of office workers in 1954 amounted to \$3,854 which was \$2,108 or 121 p.c. higher than in 1939. Office employees in Ontario with \$4,030 were the highest paid. Those in Quebec were second with \$3,827, British Columbia third with \$3,796, and Manitoba fourth with \$3,525. The fact that head offices of many large corporations are located in Montreal, Toronto, Winnipeg and Vancouver tends to raise the average salary in the provinces in which these cities are located.

Average earnings of production workers in 1954 amounted to \$2,853 which was \$1,878 or 193 p.c. higher than in 1939. The manufacturing industries of British Columbia paid the highest average earnings of \$3,221. Newfoundland with \$3,147 was in second place, followed by Ontario with \$3,026, Saskatchewan \$2,900, Alberta \$2,870, Manitoba \$2,647, Quebec \$2,614, etc. The high figure shown for Yukon and Northwest Territories in regard to average earnings of production workers is due to the unusual conditions under which industry is carried on in these regions, and is not representative. Statistics of the distribution of employees by provinces and groups as well as average annual earnings are given in Table 33.

^{1.} The averages of the number of production workers and earnings for the years 1931 to 1954 are strictly comparable with those for the years up to 1925 but not with those for the intervening years. The figures for the latest years — as for the earliest — represent the earnings for complete manyears of work, with no allowance for periods of unemployment. The difference amounts only to about 3 or 4 p.c. in the total figures and affects chiefly the seasonal industries.

2. The increase in the number of office employees in 1931 is due to the following changes in method: 1, Prior to 1931 working proprietors, such as bakers, sawmill operators, small clothing manufacturers, etc., were required to report themselves as production workers. In 1931 and subsequent years, however, all such proprietors reported themselves as office employees. 2. In 1931 travelling salesmen who were attached to the plant, and devoted all or the greater part of their time to selling the products of that plant, were included with office employees. Prior to this they were not reported at all. reported at all.

Average Annual Earnings in the Forty Leading Industries. -In 1954 there were six industries paying office workers \$4,500 or over, as compared with three in 1952. Indicative of the rapidly changing pattern of remuneration in manufacturing is the fact that in 1945, the last year of the war, no industry paid office workers annual salaries of over \$3,000, Highest average earnings in that year were \$2,935 reported by the brewing industry. Highest average earnings in 1954, amounting to \$5,502 were received by the office and supervisory employees of the pulp and paper industry which was also in first place in 1953. Other industries paying \$4,500 or more, in descending order, were as follows: breweries \$5,362, printing and publishing \$4,824, motor vehicles \$4,821, primary iron and steel \$4,807, and bridge building and structural steel \$4,707. In nineteen other industries they ranged between \$4,000 and \$4,500, in eleven they were between \$3,000 and \$4,000, while in the remaining four they were below \$3,000. Sash, door and planing mills with \$2,949, bread and other bakery products \$2,896, butter and cheese \$2,582 and sawmills \$1,872 were the four industries in this category. Average salaries in the forty leading industries totalled \$3,935 as compared with \$3,683 for the smaller industries. The lower average is due in part to a higher proportion of female office employees in the smaller industries. In the forty leading industries 26 p.c. of the office employees were female while in the smaller industries 33 p.c. were in this

The increase in average earnings of production workers since 1945 paralleled that of office and supervisory employees. Whereas in 1945 there were only four industries averaging over

\$2,000, in 1954 the number jumped to thirty-six. In 1945 the highest annual earnings, amounting to \$2,365, were paid by the motor vehicle industry, while in 1954 the highest earnings which totalled \$4,053 were paid by the petroleum products industry which has been in first place for a number of years. The highest earnings are usually paid by industries in which the proportion of skilled workers is high, and the proportion of female workers is low. There were eleven industries in 1954 with average annual earnings of \$3,500 and over. These were: petroleum products \$4,053, pulp and paper \$3,896, non-ferrous metal smelting and refining \$3,770, acids, alkalies and salts \$3,742, aircraft and parts \$3,692, bridge building and structural steel \$3,585, primary iron and steel \$3,581, breweries \$3,537, boilers. tanks and platework \$3,530, heavy electrical machinery \$3,521. and motor vehicles \$3,504. In twelve other industries average annual earnings ranged between \$3,000 and \$3,500, in nine they were between \$2,500 and \$3,000, in four they were between \$2,000 and \$2,500, while in the remaining four they were below \$2,000. This latter group includes industries made up of a large number of small establishments and in which the proportion of female workers is high. Men's factory clothing, women's factory clothing, leather footwear and fruit and vegetable preparations are the industries included in this group. Average annual earnings of production workers in the forty leading industries amounted to \$2,995 as compared with \$2,535 for the smaller industries. The lower average for the smaller industries is due mainly to a higher proportion of female workers. Employment by sex, and average annual earnings in the forty leading industries are given in Table 34.

Average Annual, Weekly and Hourly Earnings of Production Workers.—In comparing earnings by provinces or groups, consideration should be given to the type of industries in each case since the distribution of industries has a very definite regional significance. In some industries a labour force possessing deftness and speed or the ability to exercise muscular strength is necessary, in others the labour force must exercise craftsmanship or possess a high degree of technical knowledge. Workers in the latter industries naturally command relatively higher payments than those employed in industries whose employees are routine workers.

The ranking of provinces and industries as regards annual earnings is in many cases different to that of weekly or hourly earnings since the factors of number of weeks worked per year and number of hours worked per week enter into the picture. So that, while in general the same observations apply, a close study of the differences between the averages shown in Tables 33 and 34 will be of value.

The figures for the years 1934 to 1945 given in Table 35 are based on an analysis of a pay-list covering one week in the month of highest employment. For this reason the figures do not refer to any particular month, since the month of highest employment might be May for one firm and October for another; they represent the summation of the different months of highest employment as reported by all the firms. For a particular industry, however, the month of highest employment is more significant as in such a case it coincides for a great number of firms engaged in the same industry. The figures since 1946 are based on returns received from establishments employing 15 hands or over, and for 1946 and 1947 they refer to the last week in the month of November, whereas for 1948-1954 they refer to the last week in the month of October.

Average weekly earnings of male production workers for manufacturing as a whole amounted to \$63,98 in 1954, an increase of \$16.65 or 35 p.c. as compared with 1949. Average hourly earnings advanced from \$1.07 in 1949 to \$1.51 in 1954, an increase of 41 p.c., while annual earnings at \$3,145 were 37 p.c. higher. There are wide regional and industrial variations in hourly earnings. British Columbia is the highest paying province, the hourly earnings for male production workers being \$1.75 in 1954 as compared with \$1.51 for Canada as a whole. Ontario with \$1.59 was second while Prince Edward Island with 97 cents was the lowest. On an industrial basis, male workers in the products of petroleum and coal industries were the highest paid with an hourly average of \$1.89 while the leather products group had the lowest average of \$1.15.

Female production workers received on an average \$35.90 per week in 1954, an increase of \$8.72 or 32 p.c. since 1949. Hourly earnings at 93 cents were 37 p.c. higher, while annual earnings at \$1,764 were 34 p.c. higher. In the case of females, British Columbia with \$1.10 per hour was also the highest paying province, while Newfoundland and Prince Edward Island with 55 cents were the lowest. The transportation equipment group with \$1.32 per hour paid the highest wages to its female production workers, and the leather products group the lowest with 79 cents per hour. The leather products group had the lowest hourly earnings for both male and female production workers.

The following table gives the weekly and hourly earnings of male and female production workers for each province and major industrial group for the year 1954.

For the method used in calculating average annual earnings for male and female production workers separately, see text preceding Table 38.

TABLE 35. Average Annual, Weekly and Hourly Earnings of Production Workers, Employed in the Manufacturing Industries, 1934-54

Note. Butter and cheese factories and fish curing and packing plants are excluded in the years 1938 to 1945, while sawmills are also excluded in 1945. By including sawmills, weekly earnings in 1945 would have been about \$34,35 for male wage-earners.

2. The average annual earnings are calculated on the basis of the total amount paid during the year as reported to census of industry, while the weekly earnings are based on an analysis of the pay-list for the last week in October and only cover establishments employing 15 hands or over. The drop in the average annual earnings is due in part to these factors as well as to the fact that in 1951 statistics for the processing of fish in Newfoundland were included with manufactures for the first time. As this is a seasonal industry annual earnings are, therefore, lower. In 1951 average annual earnings of production workers for both sexes for this industry averaged \$1,151 as compared with \$2,806 for the other industries of the

Note: Average annual earnings cannot be calculated without a recompilation of the figures for 1946 and 1947 on the new standard classification basis.

Average Annual, Weekly and Hourly Earnings of Supervisory and Office Employees. - Beginning with 1946 the survey on weekly earnings and hours worked by production workers was expanded to include office employees as well. The survey covers establishments employing 15 hands or over and refers to the last week in November for 1946 and 1947, and to the last week in October for 1948-54. Earnings and hours worked are reported for male and female workers separately in 13 groups of hours, ranging from 30 hours or less to 65 hours or more. The earnings reported for the week is the gross amount paid before deductions for income tax, unemployment insurance, etc. Weekly and hourly earnings as well as the hours worked are thus obtained directly from the tabulated results of the establishments covered. The annual earnings, however, have to be calculated as they are not directly obtained from the survey. To calculate annual earnings the results on weekly earnings are correlated with the results obtained through the annual Census of Industry. The following case will illustrate the method used

In 1949 the paper products group, according to the annual census of industry, reported 9,077 male and 3,573 female office employees with total payments of \$46,537,336. From the October survey on weekly earnings this group showed \$77.41 per week for male and \$34.88 per week for female office employees. The proportion of female to male earnings is therefore $.451\begin{bmatrix} \$34.88\\ \$77.41 \end{bmatrix}$ Female employees are first reduced to a male basis and the calculation is then as follows:

Annual Earnings of Male Employees

 $\frac{\$46,537,336}{9,077+.451\ (3,573)} = \frac{\$46,537,336}{10,688} = \$4,354$

Annual Earnings of Female Employees

 $$4,354 \times .451$ = \$1,964

In the foregoing calculation the assumption is made that annual earnings of male and female employees vary in the same proportion as their weekly earnings. In the above illustration it may also be noted that the calculated annual earnings for male employees amounting to \$4,354 are higher than the weekly earnings multiplied by 52 which total only \$4,025 ($\77.41×52). This difference is due to the fact that the earnings reported to the Census of Industry include payments to executives as well as bonuses to employees which are usually paid at the end of the year, while the earnings reported for the one week in the year exclude such payments.

It is the intention in future to alternate the system of classifying employees. One year the basis will be the hours worked per week and the following year it will be on the basis of the earnings per week. Information will thus be made available on both the number of hours worked as well as the range of weekly earnings of employees engaged in manufacturing.

Annual earnings of male office employees in 1954 averaged \$4,499, weekly earnings \$90.99 and hourly earnings \$2.31. For female office employees annual earnings averaged \$2.227, weekly earnings \$45.00 and hourly earnings \$1.19. Average annual earnings of all office employees totalled \$3,854 in 1954, an increase of 70 p.c. since 1946. Weekly earnings at \$77.81 were 77 p.c. higher and hourly earnings at \$2.00 were 87 p.c. higher. Male employees in the products of petroleum and coal group received the highest salaries of \$116.07. Paper products came second with \$109.16 and leather products last with \$77.23. In the case of female employees, salaries paid by the products of petroleum and coal group at \$54.20 per week were also the highest. Tobacco and tobacco products with \$53.44 was second and leather products with \$38.96 last.

The following table gives the weekly and hourly earnings of male and female office workers for each province and major industrial group for the year 1954.

Note, Average annual earnings cannot be calculated without a recompilation of the figures for 1946 and 1947 on the new standard classification basis.

Office Workers and Other Salaried Employees.—A survey of weekly earnings of supervisory and office employees, classified into (a) managerial and professional employees and (b) office workers, was undertaken for the first time in 1951 and repeated again in 1954. It is the intention to repeat this survey every third year in the future. According to Table 41 below average weekly salaries of all office and supervisory employees in 1954 averaged \$77.81. Male employees received \$90.99 and female employees \$45.00. The increase per week since 1951 for all employees totalled \$11.83, for males \$13.44 and for females \$6.58.

The average weekly salaries of office workers rose in the three years from \$51.14 to \$59.29, an advance of 15.9 p.c. as compared with 17.9 p.c. for all salaried employees. The average for men classed in the office group increased by \$10.26 to \$70.94, and for women by \$6.39 to \$44.16, representing an advance of 16.9 p.c. in each case. The upward movement was more pronounced in the durable goods division than in non-durables. Higher earnings for office workers were reported in 1954 in all provinces and industry groups, except tobacco and

tobacco products, where the men's average salary, at \$68.31 was \$1.87 below the 1951 figure. The drop was caused mainly by the transfer of a group of employees to a separately organized sales office since 1951 when they were paid well above the general level.

The residual group of salaried employees, composed mainly of managerial, professional and related staffs and professional salesmen, comprises a varied group, the composition of which may differ from firm to firm. Its components are affected not only by varying requirements for administrative and professional personnel but also by the extent to which proprietors and firm members (excluded from the survey) undertake such duties, and by the organization of separate sales offices. The managerial and professional employees reported in 1951 averaged \$98.38 for the week; the men earned \$99.73 and the women \$57.04. Three years later, the averages were \$109.67 for both sexes, \$111.14 for men and \$64.89 for women. All industry groups and provinces reported higher earnings in 1954, raising the average salaries of the men to more than \$100 a week in most of the major industries in Canada.

TABLE 41. Average Weekly Earnings of the Supervisory and Office Employees in the Manufacturing Industries of Canada, Classified on the basis of (a) Managerial and Professional Employees and (b) Office Workers, by Province and Industrial Group, 1951 and 1954.

Distribution of Employees on the Basis of Weekly Earnings. Manufacturers were required to classify their male and female employees into 16 groups of earnings, from \$10 or less to \$100 or more, rising by \$5 intervals from \$10 to \$59.99, and by \$10 intervals from \$60 to \$99.99. The 1950 survey which covered the last pay period in October made available data on the distribution of employees by earnings groups for the first time since the Census of Manufactures survey in January 1944. The data in the two surveys are not strictly comparable, largely because the earlier surveys included establishments employing less than 15 persons and were conducted for a different period of the year. Also the 1944 survey reflected wartime conditions.

Variation in the provincial distribution of employees by amounts earned are obviously related to pay levels, occupational and sex differences, number of casual and part-time workers, and length of the working week in the more important industries in each area. Most of the employees in the lowearnings ranges are casually-employed workers, or those who do not work full time in the week. Part-time work is particularly common among women; the 1952 survey showed that 11.9 p.c. of the female production workers reported in manufacturing worked 30 hours or less, as compared with 4.6 p.c. for men. Short-time or casual work is characteristic of such industries as fish processing and fruit and vegetable canning, the duration of employment depending on the immediate availability of materials.

The tremendous change in the level of incomes of factory workers since the war is strikingly illustrated in Table 42. Whereas in 1940 only 3 p.c. of male and none of the female production workers received \$50 or more per week, in 1953 these percentages jumped to 78 and 14 respectively. The percentage of employees in the lower income groups declined accordingly. Whereas in 1940, 72 p.c. of male production workers received less than \$30 per week, in 1953 the percentage declined to 5. For female production workers the percentage in these groups declined from 99 to 38.

For office workers information on the distribution by income groups is only available for 1944, 1950 and 1953. Earnings by office workers, too, advanced to unprecedented heights. The percentage of male office workers receiving \$50 or more per week rose to 88 in 1953 from 39 in 1944, while for females the percentage in 1953 was 25 as compared with none in 1944. Tables 43 and 42 give the distribution by income groups of male and female production workers as well as office workers by provinces and major industrial groups for 1953.

Real Earnings of Employees in Recent Years.—When the index number representing the average yearly earnings of production workers is divided by the consumer price index, on the same base, a mesure of "real" income is obtained. Index numbers for 1931 to 1954 are given in Table 45. In 1933,

the height of the depression, real earnings were 63.9 on the 1949 base. From then on they rose steadily and stood at 101.5 in 1944, an increase of about 59 p.c. In 1946 real earnings dropped to 94.6 and rose again to 118.8 in 1954.

Percentages of Salaries and Wages to Net Value of Products. — Table 46 shows the relation between salaries and wages paid by manufacturers and the total net value of production. Figures of gross production are often used in such calculations, but the values out of which the wages of employees must come in the long run are the values added to the raw materials while they are in the factory. Such added values constitute the real production of the manufacturing plant and are alone available for payment of salaries and wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met. The percentage of salaries declined steadily with the increasing manufacturing production from 1924 to 1929, while from 1931 to

1935 and again in 1938 and 1939, due to decreased industrial activity, the percentage of salaries to value added was above normal. It should be borne in mind, however, that salaried employees increased 330 p.c. during the period 1917-54 while wage-earners increased 83 p.c. The percentage of wages has fluctuated much less than that of salaries. The number of wage-earning employees may be more rapidly adjusted to the activity of the industry and wage levels likewise may be more readily adjusted to the price levels of the products. Of the increase in the net value of production since 1939 amounting to \$6,371,072,236, \$3,158,876,538 or 49.6 p.c. was passed along in increased salaries and wages.

^{1.} Equivalent to "net value of products", see footnote 1, Table 1.

Subsection 6. Size of Manufacturing Establishments

The size of the manufacturing establishment is generally measured either by the value of product or by the number of employees, but each of these methods has its limitations. The latter takes no account of the differences in capital equipment at different times or in various industries and obviously the increased use of machinery, as in the flour-milling industry, may lead to an increase in production concurrently with a decrease in number of employees. The former measure has to be adjusted for changes in the price level and, as between industries, it makes those in which the cost of raw materials is relatively high appear to operate on a larger scale.

Size as Measured by Gross Value of Products.—While in 1922 the 420 establishments each producing over \$1,000,000 had an aggregate value of products of \$1,268,056,129 or 51 p.c. of the total production of all manufacturing industries, the 719 establishments producing over \$1,000,000 each in 1929

had an aggregate value of products of \$2,516,064,954, or 62 p.c. of the grand total for all manufacturing establishments - a very significant change in the short period of eight years. In 1931, however, the number of plants with a production of over \$1,000,000 dropped again to 482, their output being valued at \$1,451,658,954, or 53 p.c. of the total. With the increased production resulting from war needs, the number of plants with a production of \$1,000,000 or over jumped to 1,376 in 1944 and their output was about 75 p.c. of the total value of manufactures. With the end of the war and the consequent decline in production of the huge war plants the number of establishments with a production of \$1,000,000 or over, although increasing to 1,442 in 1946, nevertheless saw a decline in the proportion of their output to 67 p.c. of the total. With increased prices and an expansion in the physical volume of production during 1947 to 1954, establishments with a production of \$1,000,000 or over increased to 2,525 while their contribution to the total output rose to 78 p.c.

^{1.} Under this heading are included only those head offices which are not located at the plant.

Size as Measured by Number of Employees. - In 1929, establishments employing 501 hands or over accounted for 27.3 p.c. of the number of employees engaged in manufacturing The tendency then in evidence of increasing concentration into larger units was checked by the depression, the percentage dropping to 20.5 in 1933, (central electric stations included), but rising again to 25.6 in 1939. The same holds true for establishments employing 101 hands or over. In 1929 they employed 61.9 p.c., in 1933, 55.7 p.c. and in 1939, 61.5 p.c.

The effect of the War on the concentration of industries into large units is illustrated by the increase in the number of establishments employing 500 hands or over. In 1939 such establishments numbered 172 and employed 25,6 p.c. of the total number of employees engaged in manufacturing. By 1944 the number had increased to 383 and the percentage of total employees to 47.0. In a further subdivision of this group in 1944 it was found that 226 establishments employed between 500 and 999 persons, 56 between 1,000 and 1,499, and 101 employed over 1,500. Altogether there were 12 plants employing over 7,000 persons, the largest having an employment of a little over 13,000 with the next three largest employing between 9,000 and 10,000. Three other plants employed between 8,000 and 9,000 persons, while the lowest five plants in this group employed between 7,000 and 8,000 workers.

With the resumption of peace-time production the larger establishments declined in size so that by 1954 only 62 establishments employed over 1,500 persons, as compared with 101 in 1944. The largest manufacturing plant in Canada in 1954 employed over 14,000 the next four largest over 8,000 while the next three largest had over 6,000. The following is the size distribution of the highest group, 1,500 and over

Employees	Establishments
1,500 to 2,999	45
3,000 to 3,999	3
4,000 to 4,999	, 4
5,000 to 5,999	. 2
6,000 and over	8
Total	62

Size of Establishment in Leading Industries.—Table 53 summarizes the degree of concentration in some of the leading industries of Canada. Concentration is extremely marked in the case of motor vehicles, non-ferrous metal smelting and refining, railway rolling-stock, cotton yarn and cloth, primary iron and steel, pulp and paper, and heavy electrical machinery; whereas

in the case of women's factory clothing, miscellaneous food preparations, furniture, butter and cheese, bread and other bakery products, fruit and vegetable preparations, sawmills and men's factory clothing, the degree of concentration is low. This concentration is analysed in detail for each of the twenty-five leading industries in the tables following.

TABLE 53. Percentage Importance of Establishments, each Employing 200 or more Persons in the Twenty-Five Leading Industries, 1954

No.	Industry	Number of such establishments	Percentage of total number in the industry	Percentage of total shipments in the industry
1	Pulp and paper	77	61.6	94.3
2	Non-ferrous metal smelting and refining	18	81.8	99.3
3	Petroleum products	16	26. 2	83.0
4	Slaughtering and meat packing	31	20.1	75.2
5	Motor vehicles	10	50.0	98.5
6	Sawmills	22	0.3	27.2
7	Butter and cheese	17	1.2	19.0
8	Primary iron and steel	14	27.5	91.6

Subsection 7. Fuel and Power Consumption

Cost of Fuel and Electricity. - Fuel is used quite generally throughout the industrial field for the generation of power by means of steam and internal combustion engines. It is also used for the heating of plants, and for providing the heat necessary to some manufacturing processes. The most important industries where heat is applied to the materials to facilitate or accomplish the desired transformation are foundries and machine shops, brick, tile, lime, and cement-making, petroleum refining, the glass industry, distilleries, food preparation, rubber goods, etc. Fuel used for such heating purposes, as well as for power, is included in the figures of Table 55. In addition to the electricity used for ordinary power purposes, the figures include also the electricity used for heating boilers in the pulp and paper industry. Consumption of surplus energy in electric boilers increased rapidly during the years preceding the Second World War.

The figures of the table do not include coke charged to iron-blast furnaces or foundry cupolas. Neither do they include fuels that constitute the raw materials to be transformed, as coal in the coke and gas industries and crude petroleum in the refining industry.

The value of purchased fuel consumed increased 365 p.c. from 1939 to 1954. Part of the increase was due to an increase in the quantity used and part to the rise in the unit cost of fuels of all kinds. The cost of electricity purchased, on the other hand, has increased during the same period by 215 p.c. The groups of industries in which fuel was most extensively used in 1954 were: paper products, non-ferrous metal products, foods and beverages, iron and steel products, products of petroleum and coal, non-metallic mineral products and chemicals and allied products.

Of the total cost of purchased fuel and electricity for Canada as a whole in 1954, 62.5 p.c. was for fuel and 37.5 for electricity. Percentage wise, Newfoundland with 89.5 p.c. of the Provincial total was the largest user of fuel, while Quebec with 51.2 p.c. was the smallest. Provinces lacking in water power resources naturally have to rely on fuel for power, and for this reason the percentage that fuel is to the total is much higher than in Provinces such as Quebec where there is an abundant supply of water for power purposes. In the Provinces of Prince Edward Island, Nova Scotia, New Brunswick, Saskatchewan, and Alberta, primary power produced from fuels is an important factor in power utilization.

Power Consumption.—Power equipment installed In manufacturing establishments is a very good barometer of the industrial development of Canada, inasmuch as production is increasingly dependent on power equipment. Increases and decreases in productive capacity, measured in horse-power.

are not the result of temporary fluctuations in cost and values in the same manner as capital investments, values of products, etc. Of course, power equipment installed is not a measure of the actual utilization of power for there is generally an excess over actual requirements, i.e., over power equipment in operation. Producers must have an installed operating margin in excess of normal requirements to provide for booming business conditions or breakdown of part of the plant. In times of depression this margin increases. During short periods of expanded production, the number of horse-power per wage-earner tends to decrease in view of the fact power equipment is not immediately increased, the expanded production being secured through overtime work or an increase in the number of shifts worked.

Of the total increase in power equipment employed in manufacturing industries between 1939 and 1953, 75 p.c. was in electric motors operated by power purchased from central electric stations. However, some sections of Canada are not well provided with water power and in such sections primary power derived from steam engines or turbines, and internal combustion engines - which include all gasoline engines, gas engines (natural, coal, and producer gas), and compressionignition engines -also has increased rapidly during the period covered. During the period 1939-1953 there was an increase of 31 p.c. in the capacity of hydraulic turbines and water wheels, 56 p.c. in the capacity of steam engines and steam turbines, 115 p.c. in the capacity of electric motors, while internal combustion engines increased more than fivefold. The collection of statistics on power equipment was discontinued in 1949, but was collected again for 1953.

Power consumed by the manufacturing industries, purchased power as well as power generated for own use, totalled 42.4 billion K.W.H. in 1954, an increase of 118 p.c. as compared with 1939. Of the total consumed, Quebec used 54.9 p.c., Ontario 26.2 p.c., British Columbia 9.5 p.c., Newfoundland 2.2 p.c., New Brunswick 2.1 p.c., and Manitoba 1.8 p.c.

The paper products group with 37.1 p.c. of the total was the largest user of electric power. This group was also the largest user of purchased fuel. The non-ferrous metal products group was the second largest user of power with 32.3 p.c., followed by chemicals and allied products with 9.9 p.c., iron and steel products 5.5 p.c., non-metallic mineral products 3.7 p.c. and foods and beverages 2.8 p.c.

Table 55 gives details of purchased fuel and electricity as well as power consumption by industrial groups and provinces. Table 56 gives details of power equipment and Tables 57 and 58 give details of fuel consumption for selected years from 1926 to 1953.

Exclusive of the Butter and Cheese industry in the province of Quebec.
 Not collected.
 Includes manufactured and natural.
 Electricity purchased for metallurgical purposes in the non-ferrous Metal Smelting and Refining is included for the first time.

Newfoundland included.
 Included in the total.
 For 1926, 1923 and 1933, fuel and electricity used by "Dyeing, cleaning and laundry work" and by "Central electric stations" have been deducted from the totals in order to make the series comparable with current data.

Electricity purchased for metallurgical purposes in the Non-ferrous Metal Smelting and Refining is included for the first time.
 Newfoundiand included.
 Included in total.
 For 1926, 1929 and 1933, fuel and electricity used by Dyeing, cleaning and laundry work" and by "Central electric stations" have been deducted from the totals already published in order to make the series comparable with current data.

PART II. PROVINCIAL AND LOCAL DISTRIBUTION OF MANUFACTURING PRODUCTION

SECTION 1. TYPE AND CONCENTRATION OF MANUFACTURING PRODUCTION

This part of the Report is introduced by a general analysis of the concentration of the manufacturing industries in the provinces. In the sections that follow, the principal features of the manufactures of each province are brought out and finally the distribution of manufacturing throughout the principal cities and towns of Canada is shown.

Ontario and Quebec are by far the most important manufacturing provinces of Canada. Their combined production in 1954 amounted to \$13,928,953,858 or 79 p.c. of the total gross value of manufactured products. The proximity of Ontario to the coal-fields of Pennsylvania, the water power and other varied resources of the provinces, and their nearness to the

larger markets of Canada and the United States have all contributed to this progress.

Table 1 shows the outstanding predominance of Ontario and Quebec in each industrial group. Quebec leads in the manufacture of tobacco and tobacco products, textiles (except clothing), clothing (textile and fur), and paper products. In each of the other groups Ontario has the greater production of the two provinces. In the production of wood products British Columbia with 40 p.c. of the total holds the dominant position, outranking both Ontario and Quebec which account respectively for 24 and 22 p.c. of the total. In each of the other groups Ontario and Quebec lead by a wide margin.

TABLE 1. Summary Statistics of Manufactures of Each Province, Classified by Industrial Groups, 1954

Confidential. Included with miscellaneous industries.
 Confidential. Includes all groups marked with 1.
 Includes all groups for which figures cannot be published and which are marked with 1.
 Includes all groups for which figures cannot be published and which are marked with 1.
 Includes iron and steel products, non-ferrous metal products, products of petroleum and coal, and chemicals and allied products.
 Publication of these figures was authorized by the firms concerned.

The degree of concentration of manufacturing in large units is illustrated in Table 2. In Newfoundland 41.1 p.c. of all persons engaged in manufacturing were employed in establishments having 500 or more employees, as compared with 35.9 p.c. for Canada as a whole. Newfoundland thus assumed the premier position in 1954, displacing Ontario which ranked first formerly. Ontario ranked second with 39.2 p.c., followed by Quebec with 36.9 p.c., Nova Scotia 29.5 p.c., New Brunswick 29.1 p.c., British Columbia 26.6 p.c., Manitoba 23.5 p.c., and Alberta 15.1 p.c. There were no plants in either Prince Edward Island or Saskatchewan with an employment of 500 or more persons.

TABLE 2. Concentration of Manufacturing Production in Each Province, 1954

Province	Number of establishments employing 500 or more persons	Percentage of total number of establishments in province	Provincial percentage of number of employees accounted for by these establishments
Newfoundland Prince Edward Island Nova Scotia New Brunswick Quebec Ontario Manitoba Saskatchewan Alberta British Columbia Yukon and Northwest Territories Canada	3 -6 7 128 182 9 9 -7 28 -370	0.4 	41. 1

SECTION 2. THE MANUFACTURES OF THE ATLANTIC PROVINCES

The Atlantic Provinces are of economic importance in a number of fields, such as pulp and paper, fish processing, sawmills and primary iron and steel. In Newfoundland manufacturing production is dominated by the forest and fisheries resources. Pulp and paper was the most important industry in 1954 with shipments valued at \$62,125,755, followed by fish processing with \$13,148,467. These two industries accounted for 69 per cent of the total production of the Province. In Prince Edward Island agriculture and fishing resources make butter and cheese, slaughtering and meat packing, fish processing, and prepared stock and poultry feeds the leading industries. Nova Scotia is renowned for its coal mines and its fisheries as well as extensive forests and agricultural lands and is favoured with easy access by sea to the high-grade iron-ore supply of Newfoundland. On these resources are based the leading manufactures of fish processing, primary iron and steel, shipbuilding and repairs, pulp and paper, sawmills, railway rolling stock, and butter and cheese. In addition, important petroleum refineries; cotton yarn and cloth; and coke and gas plants add to the diversification in the Province. The forests of New Brunswick give a leading place to its pulp and paper and sawmilling industries. Other important manufacturing and processing are based on fish and agricultural resources.

Nova Scotia and New Brunswick, despite the lack of large rivers, have valuable sources of hydraulic power, a considerable

portion of which has been developed. Tentative estimates give Newfoundland a potential of almost 1,000,000 h.p. at ordinary minimum flow, while in Labrador, the Hamilton River is outstanding as a potential source of power. Turbine installation at the end of 1954 totalled 323,150 h.p. in Newfoundland, 1,882 in Prince Edward Island, 170,908 in Nova Scotia and 164,130 in New Brunswick. Compared with Quebec, Ontario and British Columbia, the installed power in the Atlantic Provinces, is very small, amounting to 660,070 h.p. This compares with a total of 1,125,445 in the Prairie Provinces and 16,684,131 in the whole of Canada.

Considering the Atlantic Provinces as an economic unit, pulp and paper was the leading industry in 1954 with factory shipments valued at \$171,603,019. This was followed by fish processing with \$78,323,308, sawmills \$37,535,088, primary iron and steel \$32,270,425, shipbuilding and repairs \$31,039,179, and railway rolling stock \$23,399,221. These six industries accounted for 52 per cent of the total production of the Atlantic Region. Other leading industries, in order of value of factory shipments, and with shipments valued at \$10,000,000 or more, were: sugar refining, butter and cheese, petroleum products, slaughtering and meat packing, sash, door and planing mills, bread and other bakery products, miscellaneous foods, breweries, prepared stock and poultry feeds, and printing and publishing.

According to the table below, manufacturing establishments reporting in 1954 numbered 3,582 for the Atlantic Provinces as a whole. These plants furnished employment to 63,384 persons who received \$159,951,065 in salaries and wages. They also

shipped goods with a selling value at the factory of \$720,460,846 and spent \$382,015,377 for materials, while the value added by manufacture totalled \$313,322,336.

Principal Statistics of the Atlantic Provinces, 1954

Province	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments
	No.	No.	\$*000	\$*000	\$'000	\$ 2000
Newfoundland	790	9, 892	30, 101	46, 503	59,484	109, 568
Prince Edward Island	209	1,774	3,000	17. 002	6,045	23, 470
Nova Scotia	1, 526	29, 611	71, 740	161, 295	129,778	300,073
New Brunswick	1,057	22, 107	55, 109	157, 216	118,016	287, 351
Total	3,582	63, 384	159, 950	382, 016	313, 323	720, 462

In the Atlantic region the program of industrial development has been more selective than in some of the other provinces. Fish processing, new sawmills, increased pulp-making capacity and the manufacture of non-metallic building materials like cement and gypsum products have accounted for well over half of the industrial growth. There are, however, a few outstanding exceptions. Two sizeable defence plants have been established in Nova Scotia, one to repair and overhaul naval aircraft and the other to build and repair radar and related electronic equipment. Considerable development has taken place in Newfoundland. Besides plants for the manufacture of cement and gypsum wallboard and plaster, factories for producing boots and shoes, birch veneer, leather goods, industrial machinery and a leather tannery were established, thus broadening the industrial base of the province. With these exceptions, most of the developments in the Atlantic Provinces have been either small and scattered or confined to the modernization and expansion of manufacturing facilities that were already established at the close of World War II.

In spite of the rapid development in the Atlantic Provinces since 1949 manufacturing production did not quite keep pace with the development in the more industralized provinces of Ontario, Quebec and British Columbia. This is indicated by a

slight drop in the Atlantic Provinces' share of the Canadian total which declined from 4.52 in 1949 to 4.10 in 1954. In number of persons employed there was a decrease of 0.2 per cent for the Atlantic Provinces as compared with an increase of 8.1 per cent for Canada as a whole. For salaries and wages paid the increase was 34.2 per cent as compared with 50.2 per cent for Canada, and in selling value of factory shipments the increase was 25.3 per cent for the Atlantic Provinces and 40.6 per cent for Canada as a whole.

Up to 1952 the increase in employment in the Atlantic Provinces was about the same as for Canada as a whole. In 1953 and 1954, however, employment in the Atlantic Provinces declined by 1.2 p.c. and 8.0 p.c. respectively, while for Canada as a whole there was an increase of 3.0 p.c. in 1953 and a decline of 4.5 p.c. in 1954. The increased employment since 1949 reported by Newfoundland, Prince Edward Island and Nova Scotia was offset by a drop of 5.7 p.c. in New Brunswick, resulting in a net decline of 0.2 p.c. for the Atlantic Provinces as compared with an increase of 8.1 p.c. for Canada as a whole. Selling values of factory shipments were 25.3 p.c. higher in the Atlantic Provinces while for Canada as a whole they were 40.6 p.c. higher.

Variation in Employment and ractory Shipments, 1954 Compared with 1949

TABLE 8, Principal Statistics of the Leading Industries of New Brunswick, 1954

SECTION 3. THE MANUFACTURES OF QUEBEC

Quebec with about 30 per cent of Canada's total selling value of factory shipments ranks as the second largest industrial province in Canada. Manufacturing establishments reporting in 1954 numbered 12,191. These plants furnished employment to 424,095 persons who received \$1,214,661,400 in salaries and wages. They also shipped goods with a selling value at the factory of \$5,395,786,644 and spent \$2,806,248,363 for materials, leaving the calculated value added by manufacture at \$2,448,027,538.

The manufacturing industries of Quebec, in common with many of the other provinces, went through a period of adjustment during 1954, Compared with the previous year there was a drop of 4.0 p.c. in the number of persons employed and 0.9 p.c. in salaries and wages paid, while the value of factory shipments with an increase of only 0.2 p.c. was slightly higher. The adjustment was not as severe as for Canada as a whole which saw a drop of 4.5 p.c. in employment, 1.5 p.c. in salary and wage payments and 1,3 p.c. in the value of factory shipments. The trend in Quebec was mixed, with most industrial groups reporting increased shipments. These increases were, however, offset by declines in a number of groups. The most severely affected was the transportation equipment group with a drop of 23.7 p.c. in value of shipments, followed by leather products with 6.6 p.c., textiles 6.5 p.c., clothing 5.6 p.c., wood products 5.4 p.c. and rubber goods 5.3 p.c. The iron and steel and miscellaneous industries were practically unchanged while in the remaining groups increases ranged from 1.6 p.c. for knitting mills to 19.1 p.c. for products of petroleum and coal.

Quebec has developed its \$5.4 billion manufacturing output with such leading industries as pulp and paper, non-ferrous metal-smelting and refining, petroleum products, slaughtering and meat packing, cotton yarn and cloth, men's and women's clothing, tobacco, cigars and cigarettes, synthetic textiles and silk, railway-rolling stock, leather footwear and miscellaneous electrical apparatus. In common with the rest of Canada, Quebec experienced a great industrial expansion following the second World War. Nor was this expansion confined to the existing industrial areas, but spread to many towns and villages in the accessible areas of the province.

Quebec's leading industry is pulp and paper with an output of approximately \$532 million in 1954. Quebec is a principal world centre for the production of newsprint with 55 major pulp and paper plants concentrated in the Trois Rivieres and Shawinigan Falls districts as well as along the Saguenay, Ottawa, and St. Lawrence rivers. The production of non-ferrous metals has expanded considerably during the past decade. The output of aluminum has made impressive strides during the past years and reached a record total of 557,897 tons in 1954. After the end of the war, with the disappearance of the demands for defense, surplus productive capacity appeared. New civilian uses were found to take up the slack, so that by 1948 the industry was producing 75 p.c. of its peak wartime output. To this has been added the defense demands created by the Korean war and in 1952 the peak level of production attained in 1943 has again been reached. Quebec, with its new furniture factories, its new titanium smelter and its expanded aluminiummaking facilities, is challenging Ontario's long established lead in a number of the wood and non-ferrous metal products industries

There are several important factors which contributed to the great industrial development of the Province. To begin with, the geographic situation of the Province is extremely favourable, with an excellent large harbour 800 miles inland where sea-going vessels of heavy tonnage can dock. There is also an extensive highway system linking the small rural areas to the big industrial centres. Other significant factors include abundant forest resources, water power, minerals, agricultural lands and, of even more importance, an industrious and stable population.

Quebec ranks highest in available water-power resources, having more than 40 p.c. of the total recorded for all Canada. Its power development has been remarkable and its installation of 7,773,822 h.p. at the end of 1954 represents about 47 p.c. of the total for Canada. The St. Lawrence River Beauharnois development of 1,408,000 h.p. and the Saguenay River Shipshaw development of 1,200,000 h.p. are the two largest in the country.

Two of the most important industrial developments in Quebec today are the Ungava iron ore project and the new titanium industry. With the exploitation of the Ungava iron deposits on which it is believed, the future of the great steel industries of this Continent rests, Quebec's industrial base is being expanded to the point where the future industrial development of this Province is well assured.

^{1.} Includes: Biscuits, Breweries, Brass and copper products, Brooms, brushes and mops, Cement, hydraulic, Railway rolling stock, and Sugar refining.

Quebec's industries are not as diversified as those of Ontario, although a number have an output approximately half or more of the total Canadian production. The manufacture of pulp and paper occupies the premier position. Fifty years ago this industry had hardly come into existence in the Province and in the mid-1920's the annual gross value of production had not yet reached \$100,000,000, By the end of 1954 it accounted for about 10 p.c. of the gross value of Quebec's manufactures and for about 43 p.c. of the Canadian total for this industry. Other large Canadian industries in which Quebec predominates are tobacco, cigars and cigarettes 94.6 p.c. of the Canadian total; women's factory clothing 69.4 p.c.; cotton varn and cloth 66.7 p.c.; leather footwear 59.0 p.c.; men's factory clothing 56.6 p.c.; synthetic textiles and silk 52.9 p.c.; miscellaneous electrical apparatus 44.6 p.c.; railway rolling stock 43.9 p.c.; and pulp and paper 42.9 p.c.

Quebec also predominates in a large number of the smaller industries. The candle industry contributed 97.1 p.c. of the Canadian total; men's clothing contractors 93.4 p.c.; cotton thread 84.1 p.c.; women's clothing contractors 83.4 p.c.; dyeing and finishing of textiles 80.9 p.c.; children's clothing 78.0 p.c.; embroidery, pleating and hemstitching 77.3 p.c.; lasts, trees and shoe findings 74.8 p.c.; oilcloth, linoleum and coated fabrics 74.1 p.c.; artificial flowers and feathers 72.0 p.c.; narrow fabrics 71.2 p.c.; oiled and waterproofed clothing 70.0 p.c.; fur dressing and dyeing 69.2 p.c.; boot and shoe findings, leather 68.7 p.c.; miscellaneous clothing 67.3 p.c.; corsets 64.1 p.c.; process cheese 63.8 p.c.; miscellaneous textiles 59.2 p.c.; fur goods 56.4 p.c.; asbestos products 53.8 p.c.; medicinal and pharmaceutical preparations 47.8 p.c.; woollen cloth 45.4 p.c.; buttons 43.9 p.c.; musical instruments 39.1 p.c., etc.

TABLE 9. Principal Statistics of the Forty Leading Industries of Quebec, 1954

	Industries	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments

Sugar refining is also a leading industry. Statistics, however are confidential.

SECTION 4. THE MANUFACTURES OF ONTARIO

For the manufacturing industries of Ontario 1954 was a year of recession. The selling value of factory shipments at \$8,533,167,214 were 3.9 p.c. lower. The drop in shipments was also accompanied by a contraction in employment of 5.6 p.c. and a drop in salary and wage payments of 3.1 p.c. The decline in manufacturing activity was greater in Ontario than in any other major industrial province. This is indicated by a decrease of only 4.5 p.c. in employment, 1.5 p.c. in salaries and wages paid, 1.3 p.c. in the selling value of factory shipments for Canada as a whole. As the decline in manufacturing production for Canada was the result of a drop of 8.1 p.c. in the physical output of durable goods such as transportation equipment, iron and steel products, and electrical apparatus and supplies of which Ontario is the major producer, the effects were, therefore,

more severely felt by Ontario manufacturers. In contrast to the heavy decline in the production of durable goods, non-durable goods only dropped 1.1 p.c. The other major industrial provinces, producing mainly non-durable goods, were therefore not as severely affected as Ontario.

Establishments reporting in 1954 numbered 13,178. They furnished employment to 598,914 persons who were paid \$1,954,767,388 in salaries and wages, and spent \$4,412,536,948 for materials used. The value added by manufacture which is the calculated value of production less the cost of materials used, including the cost of fuel and electricity, amounted to \$3,930,730,030.

Ontario, which is now recognized as one of the world's major industrial areas, accounts for approximately half of Canada's manufacturing production. Here, the proximity of raw materials, cheap hydro-electric power, and a strategic location in relation to export markets, not only on this continent but overseas, have been the decisive factors in the development of Ontario to its present industrial position. Most of the manufactures of the province and most of its population are located in Southern Ontario. This area has the inestimable advantage of bordering on the St. Lawrence-Great Lakes waterway system which gives access westward to the heart of the continent and eastward to the shipping routes of the world, and which is also the source of most of Ontario's hydro-electricity. Many new industrial areas are being created as new industries and branch plants of established industries are increasingly being located in the smaller towns.

Despite the great industrial progress made by other provinces. Ontario continues to maintain its predominance and in 1954 produced about 49 per cent of the nation's manufactured goods. A vast increase of steel ingot capacity is being made possible by developments at Steep Rock Iron Mines. At Sarnia, huge investments have gone into the construction of new plant for a whole group of new products based on Alberta oil flowing through the Edmonton-Superior pipe line. Other significant developments are taking place in synthetic rubber and industrial and consumer chemicals. Ontario has continued to gain in such traditional lines as motor vehicles, industrial and farm machinery, and the manufacture of household equipment. The same may be said of other "hard" goods like business and office machinery and electrical apparatus and supplies. Numerous plants making aircraft components and building materials have favoured the Toronto area, and chemical production has been rising by leaps and bounds in the vicinity of Sarnia and along the lower reaches of the St. Lawrence River between Cornwall and Kingston.

Ontario has the greatest diversification of manufacturing production of any province. Certain industries, such as the manufacture of motor vehicles, motor vehicle parts, heavy electrical machinery, agricultural implements, machine tools, starch and glucose, bicycles and the processing of raw tobacco are carried on practically in this province alone. Of the forty leading industries in Canada in 1954, a substantial number of them were dominated by Ontario's share of the total production. These industries, with the percentage which the production of each bears to that of the 1954 Canada totals are as follows: motor vehicles 98.4, motor vehicle parts 95.9, heavy electrical machinery 92.8, agricultural implements 92.4, rubber goods 81.0, primary iron and steel 77.2, radio and television sets and parts 75.3, iron castings 67.5, fruit and vegetable preparations 65.7, aircraft and parts 65.6, miscellaneous paper products 63.8, sheet metal products 59.4, printing and bookbinding 58.4, industrial machinery 57.8, brass and copper products 56.4, acids, alkalies and salts 54.5. miscellaneous electrical apparatus 53.0, boxes and bags, paper 52.5 and furniture 50.0. In addition Ontario dominated many of the smaller industries in 1954 as follows: machine tools 100.0, bicycles and parts 96.9, tobacco processing and packing 95.0, miscellaneous non-ferrous metal products 90.0, soaps and washing compounds 89.7, breakfast foods 88.8, automobile accessories, fabric 88.6, typewriter supplies 87.2, leather tanneries 87.1, wine 87.1, carpets, mats and rugs 85.9, artificial abrasives 84.3, refrigerators, vacuum cleaners and appliances 81.6, batteries 81.5, sporting goods 80.2, cordage, rope and twine 79.8, household and office machinery 75,8, wool yarn 74,5, white metal alloys 74.4, toys and games 74,3, scientific and professional equipment 72.8, boilers, tanks and plate work 72.0, heating and cooking apparatus 71.9, hardware, tools and cutlery 71.8, jewellery and silverware 71.5, animal oils and fats 69.5, feed mills 67.7, aluminum products 58.0, confectionery 55.2, knitted goods 50.5, and hosiery 46.8.

TABLE 10. Principal Statistics of the Forty Leading Industries of Ontario, 1954

No.	Industries	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments
		No.	No.	\$	\$	\$	\$
1	Motor vehicles	12	26,910	102, 393, 867	471, 422, 829	172, 132, 583	655, 662, 973

SECTION 5. THE MANUFACTURES OF THE PRAIRIE PROVINCES

The leading industries of the Prairie Provinces are those based on agricultural resources - grain-growing, cattle-raising and dairying areas. Next in importance, generally, are industries providing for the more necessary needs of the resident population, such as the baking of bread, printing and publishing, etc. The extensive railway services require large shops for the maintenance of rolling-stock, especially in the Winnipeg area. The widespread use of motor vehicles and power machinery on farms has given rise to petroleum refineries in each province. The greatly increased production of crude petroleum in Alberta seems likely to lead to further development of the refining industry. This industry has made tremendous strides in the Prairie Provinces since 1949. At that time it ranked third in importance, being outranked by slaughtering and meat packing which was then in first place and by flour mills which ranked second. Of greater significance is the fact that it has increased its proportion of the total manufacturing production of the Prairie Provinces from 8.5 p.c. in 1949 to 14.9 p.c. in 1954. Manitoba, as the early commercial centre of the prairies, has had a greater industrial development than either of the other provinces. Its natural resources of accessible water powers, forests and, more recently, minerals, have given rise to quite a diversification of industrial production. In Saskatchewan, while the main economic role continues to be played by agriculture, both oil and mineral wealth are being developed.

Considering the Prairie Provinces as an economic unit. slaughtering and meat packing had the largest value of facotry shipments in 1954, amounting to \$266,628,463, followed by petroleum products with \$212.860.105, flour mills \$96.312.106. butter and cheese \$91,480,614 and railway rolling stock \$45,203,077. These five industries accounted for about 50 p.c. of the total value of factory shipments of the Prairie Provinces. Other leading industries, in order of value of factory shipments and with shipments of \$10,000,000 or more, were: non-ferrous metal smelting and refining; bread and other bakery products; printing and publishing, breweries; sawmills; sash, door and planing mills; miscellaneous food preparations; bridge building and structural steel; men's factory clothing; furniture; sheet metal products; prepared stock and poultry feeds; printing and bookbinding; sugar refining; concrete products; pulp and paper; carbonated beverages; women's factory clothing; hydraulic cement; and paper boxes and bags.

In water-power resources, the Prairie Provinces are not so well endowed as the more highly industrialized provinces of Quebec, Ontario and British Columbia. At the end of 1954 power installation in the three Provinces totalled only 1,125,445 h.p. or about 7 p.c. of the Canadian total, Manitoba had 756,900 h.p., Saskatchewan 109,835 h.p. and Alberta 258,710 h.p. With the present developments of natural gas and oil, the Prairie Provinces, will in large measure be able to overcome a lack of water-power resources which is so vital to industrial development. Manitoba has more water-power resources and has developed them to a greater extent than either of the other Prairie Provinces. Practically all the developed sites are located on the Winnipeg River. These supply not only Winnipeg and its suburban areas but, through the transmission network of the Manitoba Power Commission, power is distributed to more than

400 municipalities and a large part of rural areas of southern Manitoba where farm electrification is a primary objective. In Saskatchewan, water-power development is confined to the northern mining districts. The southern portions of Saskatchewan and Alberta are lacking in water-power resources but have large fuel reserves. In Alberta, present developments are located in the Bow River basin and serve Calgary and numerous other municipalities between the International Boundary and the area north of Edmonton.

In the Prairie Provinces, the nature of developments vary from one province to another. Alberta has moved to the forefront, especially since 1950. There the emphasis has been more on the manufacture of machinery and equipment, including products like drill bits and tanks, heat exchangers and other bulky equipment for the burgeoning oil and gas industries. Chemicals, and especially petrochemicals, have made striking gains; second in terms of new growth, they now embrace various rayon intermediates and polythene plastics, as well as fertilizers and the manufacture of other new inorganic products like caustic soda and chlorine. Sizeable gains have been made by the expansion of food-processing plants and the construction of still more factories for making building materials.

Developments in Saskatchewan, by contrast, have continued along more or less traditional lines. The largest gains, for instance, have been recorded in food processing. Notable in this respect has been the establishment of three new freshwater fish-packing plants. The manufacture of building materials, including non-metallic mineral products and lumber, has also increased. However, the largest single gain in employment has been in the refining of prairie oil for local use.

Although Manitoba experienced a great development in manufacturing production since 1939, it did not, percentagewise, keep pace with the other two Prairie Provinces, Since 1946, however, the development was on a wide front. The increase in the number of persons employed totalled 2,893. The largest increase of 1,213 was reported by the iron and steel group. The clothing industries with 940 reported the second largest increase, while the printing, publishing and allied industries reported an increase of 782. This was followed by electrical apparatus and supplies with 353, products of petroleum and coal 266, miscellaneous industries 251, etc. Only two groups reported declines in employment; foods and beverages 1,646 and knitting mills 142. The food and beverages group which in 1946 accounted for 30 p.c. of the employment in manufacturing, accounted only for 24 p.c. of the total in 1954. The food and beverages group with 9,886 employees was still in first position in 1954 as an employer of labour, followed by transportation equipment with 6,530, clothing 5,509, and iron and steel products 4,894. These four groups accounted for 65 p.c. of manufacturing employment in Manitoba.

According to the table below manufacturing establishments reporting in 1954 numbered 4,584 for the Prairie Provinces as a whole. These plants furnished employment to 85,515 persons who received \$246,874,608 in salaries and wages. They also shipped goods with a selling value at the factory of \$1,427,420,258 and spent \$844,678,599 for materials, while the value added by manufacture totalled \$556,375,650.

Principal Statistics of the Prairie Provinces, 1954

Province	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments
	No.	No.	\$'000	\$'000	\$'000	\$'000
Manitoba Saskatchewan Alberta Total	1, 522 1, 010 2, 052 4, 584	41, 224 11, 526 32, 765 85, 515	116, 455 33, 510 96, 910 246, 875	328, 828 169, 326 346, 525 844, 679	232, 488 104, 560 219, 328 556, 376	571, 409 280, 734 575, 278 1, 427, 421

In spite of the rapid development in the Prairie Provinces since 1939, manufacturing production did not keep pace with the developments in the more industrialized provinces of Ontario, Quebec and British Columbia. This is indicated by the slight drop in the Prairie Provinces' share of the Canadian total which declined from 8.13 p.c. in 1939 to 7.91 p.c. in 1953.

In 1954 conditions were reversed. The Prairie Provinces reported an increase of 1.4 p.c. in the value of factory shipments as compared with a decline of 1.3 p.c. for Canada as a whole. As a result of this the Prairie Provinces' share of the Canadian total was again 8.13 p.c., the same as in 1939.

According to the table below, Manitoba and Saskatchewan did not keep pace with manufacturing developments in Canada as a whole. Alberta on the other hand fared much better. Compared with 1939 employment increased by 158 p.c. and the value of factory shipments by 558 p.c. This compares with increases for Canada as a whole of 93 p.c. and 405 p.c. respectively.

Variation in Employment and Factory Shipments, 1954 Compared with 1939

Province	Employees	Salaries and wages	Selling value of factory shipments
	p.c.	p.c.	p.c.
Manitoba	+ 72 + 78 + 158	+ 309 + 356 + 547	+ 325 + 363 + 558
Prairie Provinces	+ 98	+386	+405
Canada	+ 93	+428	+405

SECTION 6. THE MANUFACTURES OF BRITISH COLUMBIA

British Columbia, with factory shipments totalling \$1,474,156,242, ranked third among the provinces in manufacturing production. In spite of the rapid industrialization of other provinces, British Columbia succeeded in increasing its share of the total Canadian output. This is reflected in the increase in the total from 7.1 p.c. in 1939 to 8.4 p.c. in 1954.

Forest resources, fisheries, minerals and electric power have given a broad base and wide diversification to its industrial development. While Ontario and Quebec have an outstanding predominance in each of the major industrial groups of the Standard Industrial Classification, in the production of wood products, however, British Columbia with 40 p.c. of the Canadian total holds the dominant position, outranking both Ontario and Quebec which account respectively for 24 and 22 p.c. of the total.

Emphasizing the importance of the forests in the industrial life of the Province, the sawmilling industry ranked first with a gross value of factory shipments of \$347,883,651, and pulp and paper second with \$157,781,577. Third in importance was the petroleum products industry with factory shipments valued at \$81,547,626. This industry received a great impetus with the completion of the Trans-Mountain oil pipeline. In 1953, with shipments valued at \$40,562,462 it ranked seventh, and contributed about 3 p.c. to the total value of factory shipments of the Province. In 1954 it assumed third place with the proportion of the total increasing to 5.5 p.c. In fourth place was fish processing based principally in the estuarial salmon fisheries. This industry was in third place in 1953. British Columbia accounted for approximately 46 p.c. of the output of the fish processing industry in 1954 and plays a large part in making Canada the largest fish exporting nation in the world. Other important industries are: veneers and plywoods, slaughtering and meat packing, sash, door and planing mills, miscellaneous food preparations, ship-building, fertilizers, butter and cheese, fruit and vegetable preparations, etc. The non-ferrous metal smelting and refining industry ranks high among the leading industries. Information, however, cannot be published as there are less than three smelters located in the province.

A feature of recent progress has been that new developments are taking place in areas far removed from accepted industrial centres. Growing lines of communication and transportation are fanning out from and leading into formerly locked interior communities to tap a vast new potential and offer new sources of provincial economic unity and strength. Factories

and plants in remote sections are drawing greater value in employment and dollars from natural resources. The growth of the province industrially may be indicated by the increase in employment which is more than double the pre-war figure. In dollar terms, gross value of manufacturing is now more than double of the immediate postwar period, and up more than sixfold since 1939. The consumption of 4.0 billion kwh of electric power by manufacturers during 1954 marks a steady upward climb of 90 per cent in the past decade.

British Columbia ranks second among the provinces in available water-power resources and its hydraulic development which at the end of 1954 totalled 2,246,868 h.p., out of a Canadian total of 16,684,131 h.p., is exceeded only by Quebec and Ontario. Present developments are practically all located in the southern part of the province in the Fraser and Columbia River basins. The Aluminum Co. of Canada is making excellent progress in its great Kemano-Kitimat scheme, involving diversion of the head-waters of the Fraser River through the costal range by a ten-mile tunnel to an underground powerhouse. The highlight of hydro-electric construction in 1954 was the completion of the first stage of this project. The first three turbines, each of 150,000 h.p., were brought into operation. This power will be used in the production of aluminum which is a new product for British Columbia, Present capacity of the smelter is 91,500 tons of aluminum per annum, with a potential of 550,000 tons, a production that will further strengthen Canada's position as an important source of this vital metal.

Manufacturing establishments reporting in 1954 numbered 4,462. These plants furnished employment to 95,867 persons who received \$319,802,914 in salaries and wages. They also shipped goods with a selling value at the factory \$1,474,156,242 and spent \$794,885,369 for materials, while the value added by manufacture totalled \$651,812,950. The manufacturing industries of British Columbia expanded during 1954, at a time when the rest of Canada experienced a minor recession. For Canada as a whole there was a drop of 4.5 p.c. in the number of persons employed, 1.5 p.c. in salaries and wages paid, and 1.3 p.c. in the value of factory shipments. British Columbia was the only province in 1954 reporting increased employment in manufacturing, the increase being 2.2 p.c., accompanied by an increase of 6.3 p.c. in salaries and wages paid. Although British Columbia was not the only province to report increased shipments, the increase of 7.9 p.c. was, however, the highest of any province.

^{1.} Other leading industries for which statistics cannot be shown since there are less than three establishments in each industry are: Non-ferrous metal smelting and refining, Sugar refining, and Distilled liquors.

SECTION 7. MANUFACTURING INDUSTRIES IN URBAN CENTRES

The prosperity of most of the cities and towns of Canada, especially in the east, is intimately connected with their manufacturing industries, which provide employment for a large proportion of their gainfully occupied population. In the west the cities are more largely distributing centres, though manufactures are rapidly increasing there also.

Table 15, indicating the extent to which the manufacturing industries of Canada are concentrated in urban centres, shows

by provinces the proportion contributed by cities and towns having factory shipments of over \$1,000,000 each. In the more highly industrialized provinces of Ontario and Quebec such cities and town in 1954 accounted for 88 p.c. and 93 p.c. respectively of the totals for those provinces, while for the Atlantic Provinces and British Columbia, where sawmilling, fish-packing, and dairying are leading industries, the proportions are 72 p.c. and 59 p.c. respectively. In the Prairie Provinces manufacturing is confined to a few urban centres.

TABLE 15. Cities and Towns Each with Selling Value of Factory Shipments of Over \$1,000,000, Number of Establishments and Total Shipments in such Urban Centres as a Percentage of the Grand Total, by Provinces, 1954

Note. Statistics published in this table are in some cases higher than the figures published in Table 18, since in the table below are included towns with shipments of over \$1,000,000 for which statistics must be withheld. It is not possible to publish this information in Table 18 without disclosing the operations of individual establishments.

Province	Number of urban centres with selling value of factory shipments of over \$1,000,000	Number of establishments reporting in urban centres with selling value of factory shipments of over \$1,000,000	Selling value of factory shipments of urban centres having \$1,000,000 or over	Selling value of factory shipments of each province	Selling value of factory shipments of urban centres as a percentage of shipments in each province

Net value is derived from gross value by deducting cost of materials, fuel and electricity. For cost of fuel and electricity in 1954 see Table 18.
 Since 1952 the basis of collection was "Selling Value of Factory Shipments" instead of "Gross Value of Products".

TABLE 17. Principal Statistics of the Manufacturing Industries Located in the Metropolitan Areas of Montreal, Toronto, Hamilton, Windsor, Winnipeg and Vancouver, Grouped According to the Number of Employees per Establishment, 1954

APPENDIX II

Alphabetical List of the Products Reported as having been Manufactured in Canada in 1954

The appended list of the products of Canadian manufacturing industries presents the value and in most cases the quantity of the individual products in a much more detailed form. Prior to 1927, in presenting statistics of manufacturing production, the whole production of an establishment was taken as a unit. This not only prevented the presentation of production figures for specific products in detail, but also involved numerous inaccuracies in the production statistics of classes of commodities, owing to the fact that commodities which may be the major line of production in one establishment may also be products of secondary importance in another establishment where the major line of production puts the establishment into a different class. The statistics which follow, however. have been compiled by taking from the individual returns of each of the 38,028 manufacturing establishments covered, the value and, when given, the quantity of each commodity specified as produced by the establishment. In this way, detailed production figures are obtained for specific commodities and, furthermore, the total production of each commodity is brought together, no matter how varied may be the operations in different establishments producing it. Nevertheless it should be pointed out to those making use of these figures that there is one element of incompleteness about them. In the returns of many manufacturers, products of minor importance are grouped under the name "all other products". As will be seen from the group at the end of the list, the value of products not specified, while they may appear unimportant to the individual manufacturer, are, in the aggregate, a large amount, especially in the industries of two of the larger groups. It is obvious that one manufacturer may consider a product of insufficient importance to report separately for his establishment, while that same product may be reported separately by other establishments. In other words, included in the value of other products not specified at the end of the list, there are doubtless values which, had the products been specified by manufacturer, would have been included in the values of commodities appearing on the list, However, the products not specified total only about 2.0 per cent in value of the whole manufacturing production, although in the iron and steel group this proportion is 6.7 per cent and in transportation equipment 7.0 per cent. With the exception of these groups, therefore, the incompleteness of the figures on this account is insignificant.

There is no duplication in the listing of products, nor do any of the items, include products listed in more detail under another name. It is possible, however, that essentially the same commodity produced in different establishments may have been called by different names; in such a case, which is probably a very rare one, the items would appear separately in the following list.

It should be noted that a shipment's concept instead of the value of production concept was adopted in 1952. The new concept was applied to a large number of industries where it was known that inventory changes from year to year was only of a minor nature. The new concept was extended to other industries in 1954 and it is hoped to convert all industries to the shipment's concept by 1955. The alphabetical list of products for 1954, therefore, refers to commodities shipped and not to the value of commodities produced.

Alphabetical List of Commodities, 1954

Note:-In 1952 and subsequent years the basis of collection, is "Value of Factory Shipments" instead of "Gross Value of Products". However, the commodities marked are still on a production basis.

Items	Unit of measure	Quantity	Value of factory shipments
Abrasive cloth	_		1
Abrasive paper	_	-	1
Abrasive wheels and segments	-		4,422,413

GENERAL REVIEW OF THE MANUFACTURING INDUSTRIES OF CANADA 1955

DOMINION BUREAU OF STATISTICS

Industry and Merchandising Division

Central Assembly and Index Section

DOMINION BUREAU OF STATISTICS

Industry and Merchandising Division
Central Assembly and Index Section

GENERAL REVIEW

OF THE

MANUFACTURING INDUSTRIES OF CANADA 1955

Published by Authority of
The Honourable Gordon Churchill, Minister of Trade and Commerce

NOTICE

The annual reports prepared by the Industry and Merchandising Division of the Bureau of Statistics are divided into 3 volumes, as follows: Volume I - The Primary Industries, including mining, forestry and fisheries; Volume II - Manufacturing; Volume III - Merchandising and Services. The volumes are made up of parts, and the parts in turn are subdivided according to the industries or provinces which they comprise.

Volume II consists of the following parts, the first two of which deal with manufacturing as a whole and the balance with the major manufacturing groups.

I - General Review of the Manufacturing Industries

II - The Manufacturing Industries of Canada, (7 sections, as follows:)

Section A. Summary for Canada

Section B. Atlantic Provinces

Section C. Quebec Section D. Ontario

Section E. Prairie Provinces

Section F. British Columbia

Section G. The Manufacturing Industries of Canada, Regional Distribution

III - Foods and Beverages

IV - Tobacco and Tobacco Products

V - Rubber Products

VI - Leather Products

VII - Textile Mills

VIII - Knitting Mills

IX - Clothing

X - Wood and Paper Products

XI - Printing Trades

XII - Iron and Steel Products

XIII - Transportation Equipment

XIV - Non-ferrous Metal Products

XV - Electrical Apparatus and Supplies

XVI - Non-metallic Mineral Products

XVII - Products of Petroleum and Coal

XVIII - Chemicals and Allied Products

XIX - Miscellaneous Manufactures

The present report is the only one in Part I

PART I. GENERAL ANALYSES OF MANUFACTURING

SECTION I. GROWTH OF MANUFACTURING

In this report the manufacturing industries of Canada are dealt with in two Parts. Part I gives general analyses including the historical development of manufacturing; detailed treatment of current production under various groupings and by individual industries; and principal factors in manufacturing production such as physical volume of Production, capital, employment, salaries and wages, size of establishment, and power and fuel. Part II deals with the provincial and local distribution of manufacturing production.

With regard to historical development, it is impossible to give absolutely comparable statistics over a long period of years. From 1870 to 1915 statistics were collected only in connection with decennial or quinquennial censuses, and there was inevitably some variation in the information collected. The annual Census of Manufactures was instituted in 1917 and while numerous changes have been made since then in the information collected and the treatment of the data, an effort has been made to carry all major revisions, in so far as possible, back to 1917 so that the figures for the period since then are on a reasonably comparable basis.

The manufacturing industries of Canada during 1955 made a rapid recovery from the downward adjustment experienced in 1954. The selling value of factory shipments at \$19,513,933,811 was the highest on record and exceeded by 9.7 p.c. the previous high mark attained in 1953. In employment, however, the record was not so impressive. Although there was an increase of 2.4 p.c. in the number of employed in 1955 as compared with the previous year, the number still fell short by about 29,000 of the record number of 1,327,451 employed in 1953. Salaries and wages paid at \$4,142,409,534 and value added by manufacture at \$8,753,450,496 were the highest on record, exceeding the previous high of 1953 by substantial margins.

The physical volume of production in 1955 was 7.4 p.c. higher than in the previous year, while the increase in the value of factory shipments was 11.2 p.c. The greater increase in the value of factory shipments is accounted for by an increase in the wholesale prices of partly and fully manufactured goods which rose by about 2.5 p.c. The output of durable goods rose by 9.1 p.c. while non-durables were 6.1 p.c. higher. The total indexes of both the durables and non-durable sectors as well as for manufacturing as a whole exceeded the levels attained in 1953. Non-durable goods at 235.2 and manufacturing as a whole at 270.1 were the highest on record, while durable goods at 324.8 were still 4.5 p.c. lower than the peak attained in 1944 when these industries were engaged in war production.

In the non-durable goods sector all groups reported increased activity in 1955 as compared with 1954. The greatest increase in volume of production was reported by rubber goods with a percentage increase of 17.3. Textiles were second with 15.1, followed by products of petroleum and coal with 14.4, beverages 9.0, tobacco and tobacco products 8.6, leather products 6.3, paper products 5.2, foods and clothing 2.5, chemicals 2.4 and printing, publishing and allied industries 2.2. Textiles and clothing, although reporting increases in 1955, were still, however, below the levels attained in 1953.

In the durable goods sector, all groups with the exception of transportation equipment reported higher levels of production. Non-metallic mineral products were 15.1 p.c. higher. The output of iron and steel products with an increase of 14.1 p.c. came a close second, followed by electrical apparatus and supplies with 12.0 p.c., wood products 10.8 p.c., and non-ferrous metal products 9.8 p.c. The transportation equipment group was slightly lower with a drop of 1.2 p.c. Although the volume of the automobile industry was 29 p.c. higher, the lower levels at which the shipbuilding, aircraft and railway rolling stock industries operated, more than off-set this increase, leaving a

decline of 1.2 p.c. for the group as a whole. The iron and steel group, in spite of the recovery made in 1955, was still about 1.0 p.c. below the record level of 1953, while the transportation equipment group was still about 20 p.c. short of the high level attained in the same year.

The improvement in manufacturing operations which occurred during 1955 was the result of three main factors. First was the accelerated spending on capital goods, such as construction and machinery and equipment of all kinds, which rose from \$5,620,000,000 in 1954 to \$6.230,000,000 in 1955, an increase of 11.0 p.c. This stimulated the durable goods industries to a marked degree, and is reflected in the increased output of pig iron which rose from 2,211,029 tons in 1954 to 3,215,367 tons in 1955, steel ingots and castings from 3,195,030 tons to 4,534,672 tons, aluminum from 557,897 tons to 612,543 tons, nickel from 166,299 tons to 174,928 tons. cement from 22,437,477 barrels to 25,168,464 barrels, and motor vehicles from 352,109 units to 452,114 units. The second factor was the improvement in the export demand of many Canadian manufactured commodities. Newsprint, wood pulp, planks and boards, shingles, veneer and plywood, aluminum, nickel, copper, zinc, automobile parts and fertilizers were all substantially higher in 1955 as compared with the previous year. Exports of whisky, farm implements and artificial crude abrasives were at about the same level while exports of wheat flour and aircraft were considerably lower. The third factor was the impact on the consumer goods industries of the increase of about 400,000 in population as well as by the rise in labour income.

Ontario which is now recognized as one of the world's major industrial areas, accounts for approximately half of Canada's manufacturing production. Despite the great industrial progress made by other provinces, Ontario continues to maintain its predominance and in 1955 accounted for 49.3 p.c. of the total value of factory shipments. Quebec with about 30 p.c. of the total shipments ranks as the second largest industrial province, while British Columbia with 8.6 p.c. of the total ranks third.

The increased activity reported by the manufacturing industries during 1955 was not uniformly distributed as between provinces. From the point of view of numbers employed, British Columbia with an increase of 6.8 p.c. over 1954 made the greatest gain in manufacturing output. This was on top of a 2.2 p.c. increase the previous year, at a time when all other provinces, without exception, reported declines in employment. As a result of this uninterrupted expansion during the past few years, British Columbia is gradually increasing its share of the Canadian total. Alberta in 1955 reported the second highest expansion with an increase of 6.4 p.c. in employment, followed by Newfoundland with 4.7 p.c., Ontario 2.5 p.c., Nova Scotia 2.0 p.c., New Brunswick 1.5 p.c., Quebec 1.3 p.c., and Manitoba 0.2 p.c. Prince Edward Island and Saskatchewan reported minor declines of 0.5 p.c.

The industrial expansion of Canada since Confederation has been phenomenal. In the past generation alone, Canada has changed from a country producing and exporting mainly primary products to a country that is increasingly producing and exporting manufactured products, until to-day manufactures account for about 30 p.c. of the value of all goods and services produced, and also rank as the leading employer of labour in Canada.

Canada is no longer on the fringes of industrialization but tanks among the world's most important manufacturing countries. Basic historical developments, such as the opening of the West and the magnitude of requirements of all kinds for World Wars I and II, have been followed by recent discoveries of far-reaching significance. Such events as the discovery of a major oil pool on the prairies in 1947, the discovery of large-scale deposits of

iron and the successful search for uranium have given new dimensions to Canadian thinking and business planning. These are the factors that explain the records of capital expenditures year by year since the end of the War. Yet it is not the mere rate of expansion that is significant. There have been other periods when Canada's population has grown more rapidly and in many respects the rate of industrial expansion in the late 1920's was relatively as great as in the post-war years. The real significance of the latter period is that never before has there been an advance on such a broad industrial front.

The second point to be observed is the changing emphasis of Canadian manufacturing activity. By 1949 the period of postwar conversion was passed and Canada had entered a new phase of economic expansion which derived its dynamic from the discovery of new resources and the application of new processes. This meant that even the sharp recession in the United States in the year 1949 failed to have significant effects in Canada. The influence of Korea and the consequent rearmament program gave an added impetus to the expansion of Canadian industry and to the development of Canadian basic resources. Capital expenditures that contributed most to the defence of Canada were given priority. Additional capacity was created to meet requirements of the specialized defence program - aircraft, electronic equipment, ships and guns - many items of which had never before been produced in Canada. Measures such as steel control, credit regulations and deferred depreciation had the desired effect. A shift gradually took place toward the further expansion of basic industrial capacity and away from investment in consumer goods and services.

The stability of current levels of manufacturing is indicated by the fact that such activity is the result of business assessments of resources and market potentialities. Millions of dollars are being invested in oil because the prairies can produce oil as economically as other great fields on the North American Continent. Petro-chemical plants are being erected because the raw materials are readily at hand. Kitimat is based on the coincidence of abundant and cheap hydro-power and access to ocean transportation, both of which are essential to the low-cost production of aluminum. The exploitation of the Ungava iron deposits rests on the belief that the steel industry of the North American Continent will need the high-grade ores involved in order to meet continuing peace-time demands. No country is in a more favourable position than Canada to supply uranium for the production of atomic energy.

Of strategic importance, and probably of even greater long-term significance to the Canadian economy, has been the growing world-wide shortage of raw materials; a shortage born of rising levels of employment and income, and accentuated by the course of international events, especially since 1950. These demands have shown few signs of abating and they have led to substantial increases in Canadian primary manufacturing capacity, particularly in so far as the light metals, nickel, chemical fertilizers and the cheaper grades of paper are concerned.

In recent years the demands stemming from population growth and a rising standard of living have been noticeable at all levels. In food processing, a steady up-grading in the quality of foods sold on the domestic market has been even more important than population growth. The two together have almost doubled the dollar sales of processed foods in this country since 1945. And at the intermediate level other important changes have taken place. Many of Canada's new chemical plants, for example, have been built with the domestic consumer market in mind. Frequently using petroleum or natural gas as a source of raw materials, they have gone a long way towards making Canada independent of imports in such categories as vanillin, nylon and rayon intermediates, and plastics for packaging and similar uses.

The tremendous development which has taken place in Canada during the past twenty years is strikingly illustrated by the increase of 212 p.c. in the physical volume of manufactured products between 1935 and 1955 as compared with an increase of only 41 p.c. in the population. Part of this increase, resulted from an increased demand abroad for Canadian manufactured goods, part to the demands imposed on Canadian industry as a result of the expansion in the economy during the past decade, and part to the increase in the standard of living of the Canadian people. The increase of 293 p.c. in the output of durable goods consisting mainly of building materials, transportation equipment as well as machinery and equipment of all kinds reveals the extent of the contribution made by Canadian industry to the phenomenal expansion in the productive capacity of the country. Non-durable goods during the same period increased by 164 p.c. Although this increase is quite large it is, nevertheless, overshadowed by the huge increase of 293 p.c. in the durable goods industries of the manufacturing sector.

With few exceptions, all groups in both the durable and non-durable sectors recorded marked advances in volume of output since 1935. In the durable goods sector the most striking advance was made by the electrical apparatus and supplies group with an increase of 539 p.c. which was the highest increase of any group. This was followed closely by non-metallic mineral products with an increase of 523 p.c. Transportation equipment was third with an increase of 290 p.c., followed by iron and its products with 257 p.c., non-ferrous metal products with 245 p.c. and wood products 199 p.c.

In the non-durable goods sector the greatest advance was achieved by the beverages group with 356 p.c., with petroleum products a close second with an increase of 340 p.c. Percentage increase by the other groups of this sector were as follows: tobacco and tobacco products 276, chemicals and allied products 240, rubber goods 237, paper products 197, printing, publishing and allied industries 134, food 127, textiles 103, clothing, including knitting mills 62 and leather products 43.

Manufacturing establishments reporting in 1955 numbered 38,182. Of these 785 were located in Newfoundland, 204 in Prince Edward Island, 1,524 in Nova Scotia, 1,052 in New Brunswick, 12,194 in Quebec, 13,276 in Ontario, 1,549 in Manitoba, 960 in Saskatchewan, 2,126 in Alberta, 4,486 in British Columbia and 26 in the Yukon and Northwest Territories. These plants furnished employment to 1,298,461 persons who received \$4,142,409,534 in salaries and wages. They also shipped goods with a selling value at the factory of \$19,513,933,811 and spent \$10,338,202,165 for materials, while the value added by manufacture totalled \$8,753,450,496.

The value added is obtained by subtracting the cost of materials, including fuel and electricity, from the gross value of products. The difference represents the value added to the materials by labour. It is this difference which the employer of labour uses to pay for the labour itself, the overhead expenses, interest and profits.

To calculate the value of production, it is necessary to adjust the value of shipments for the difference in the opening and closing inventories of finished goods. As the census of industry schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added is obtained by subtracting from the shipments the cost of materials, including fuel and electricity. The value thus obtained is somewhat different to the actual value. Beginning with 1954 it is again possible to obtain value of production figures, by adding to the value shipments the changes in the inventory of finished products. The figures for value added in 1954 and 1955 are, therefore, comparable with 1951 and prior years.

Percentage variation of manufacturing in Canada, by Provinces and Groups, $1955\ {\rm compared}\ {\rm with}\ 1954$

^{1.} For 1924 and subsequent years the value added by manufacture is computed by subtracting the cost of fuel and electricity and the cost of materials from the gross value. Figures prior to 1924 are not comparable because statistics for cost of electricity are not available.

2. A change in the method of computing the number of wage-earners in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931, however, the method in force prior to 1925 was re-adopted.

^{3.} Not collected.
4. Includes Newfoundland.
5. In 1952 the basis of collection was changed from "value of products made" to "selling value of factory shipments".

TABLE 2. Summary Statistics of Manufactures, by Provinces, Significant Years, 1917-55

^{1.} Increase is due to the inclusion for the first time of establishments that publish periodicals without doing any printing.

2. In 1952 the basis of collection was changed from "value of products made" to "selling value of factory shipments".

3. There were three major changes in concept affecting the data for the Primary Iron and Steel Industry in 1954. The first one involved a change in the method of counting establishments; the second concerned a change in valuing shipments of wire rods transferred to makers' own processing plants; while the third concerned the method of calculating "value added by manufacture". Figures for 1954 are therefore not comparable with previous years. See footnotes to Table 2 of the 1954 report on the Primary Iron and Steel Industry.

4. Apparent advance in the selling value of factory shipments is due in part to an actual gain in physical output, but the major factor contributing to this increase was a change in accounting procedure by some firms of the petroleum products industry in calculating value of factory shipments. This increased the value by approximately \$139,000,000 over what the value would have been by the former method.

Significant Changes in Manufacturing Production .- The figures in Table 4 trace the tendencies in Canadian manufacturing industries as clearly as possible from 1917 to 1955. In analysing statistics of production and materials used, price changes should be norne in mind, particularly the inflation of values in the years immediately following World War I, the drop in prices of commodities during the depressions following 1921 and 1930, and the increases again in the recent war and postwar period. The figure that shows most clearly the trend of development is concerned with the use of power. The total horse-power employed increased from 1,658,475 in 1917 to 10,397,703 in 1953, an advance of about 527 p.c. in 37 years. In the same period, horse-power per production employee showed an uninterrupted trend from 3.06 to 10.82 in 1933 and 9.46 in 1939. With the large increase in the number of production employees on war production, and the more efficient utilization

of the equipment available, the horse-power per production employee dropped to 6.28 in 1944; the increasing installation of power machinery and the decline in employment after the war resulted in a rise to 8.52 in 1948 and 9.87 in 1953. The significant feature is the increase in both the absolute figures of power employed and the averages per production employee during the depression years as compared with 1929, although the large numbers of persons again finding employment since 1933 reduced the averages for the years 1934 to 1937 and again for 1940 to 1945. Other interesting comparisons are the trend of value added by manufacture, per employee, and of average earnings since 1929. Between 1949 and 1955 the value of purchased fuel and electricity increased by 49.7 per cent; for full details of fuel and electricity used by the manufacturing industries see Tables 57 and 58.

^{1.} A change in the method of computing the number of production workers in the years 1925 to 1930, inclusive; increased the number somewhat over that which the method otherwise used would have given. There was, therefore, a proportionate reduction in the averages for 1925-30 per employee as compared with what these averages would have been under the other method. In 1931, however, the method in force prior to 1925 was re-adopted. The figures for 1932 for later years are therefore comparable with those for 1924 and earlier years.

Collected only every five years. These figures are for 1953 which is the latest year available.
 See fothnote 1, Table 1.
 See footnote 5, Table 1.

Recent Changes in Manufacturing Production. - Table 5 shows the changes in the nature of manufacturing production since the end of World War II with regard to numbers employed, the salaries and wages paid, and the gross value of products. Owing to price declines during depressions and rises during periods of prosperity, the values of both wages and products are naturally affected more than the number of employees. Furthermore, during periods of curtailed production there is a tendency for production workers to be put on part time, while the number of office employees responds less quickly to reduction in output than that of production workers. Therefore, there are several reasons why the variation in number of employees should be less than that of money values. The figures of Table 5 are to be compared with those of Tables 8, 9 and 10 which show changes in volume of production. The number of employees in 1944 increased by 86 p.c. over 1939. Salaries and wages paid were 175 p.c. higher and the gross value of production 161 p.c. higher. Another significant change is the increase in the proportion of women engaged in manufacturing. Whereas in 1939, there were 281 females to every 1,000 males employed. in 1944 this figure jumped to 403.

Significant changes in the nature of manufacturing production took place after the cessation of hostilities in 1945. Industries engaged in war production operated at a substantially lower level, while industries producing consumer goods stepped up their production. From the point of view of employment the chemical and allied products group with a drop of 33 p.c. experienced the greatest decline in production between 1945 and 1949. Transportation equipment which includes aircraft and shipbuilding was second with a drop of 32 p.c., followed by tobacco and tobacco products with 12 p.c., rubber goods 12 p.c. and iron and steel products 3 p.c. The non-metallic mineral products group reported the greatest gain in employment with an increase of 39 p.c., followed by printing, publishing and allied trades 31 p.c., wood products 29 p.c., electrical apparatus and supplies 27 p.c., products of petroleum and coal 26 p.c., paper products 21 p.c., textiles (except clothing) 19 p.c., clothing (textile and fur) 18 p.c., foods and beverages 8 p.c., leather products 2 p.c. and non-ferrous metal products 1 p.c.

For manufacturing as a whole there was an increase of 4 n.c. in the number of employees with an increase of 39 p.c. in the amount of salaries and wages paid. Although there was an increase of 50 p.c. in the gross value of production, the increase in the physical volume was only 3.4 p.c. This is due to the rise in the wholesale prices of fully and partly manufactured products.

Between 1949 and 1954, for manufacturing as a whole. there was an increase of 40.6 p.c. in the gross value of production, 8.1 p.c. in employment, and 75.5 p.c. in salaries and wages paid. In terms of employment, the electrical apparatus and supplies group with an increase of 34.3 p.c. experienced the greatest expansion since 1949. Transportation equipment came second with 27.4 p.c., followed by non-metallic mineral products with 25.2, chemicals and allied products 24.9, products of petroleum and coal 20.7, miscellaneous industries 17.7, paper products 14.3, non-ferrous metal products 13.0, and printing, publishing and allied industries 11.0. The smallest gain was reported by the rubber products group with 0.8 p.c. Four groups reported declines in employment. Textiles led the list with a drop of 17.0 p.c., followed by leather products with 11.9, tobacco and tobacco products 11.4 and clothing 5.5.

Significant changes have also occurred regionally between 1949 and 1954. In terms of employment, there was an increase of 8.1 p.c. for Canada as a whole. With the exception of two provinces, New Brunswick and Manitoba, all other provinces reported increased employment in manufacturing. Alberta led in this respect with an increase of 24.0 p.c., followed by British Columbia with 15.6 p.c., Newfoundland 13.2 p.c. and Quebec 8.7 p.c. These four provinces were above the Canadian average of 8.1 p.c. Four other provinces also reported increases in employment, but below the Canadian average. Of these Ontario reported an increase of 7.5 p.c., Saskatchewan 6.3 p.c., Prince Edward Island 1.5 p.c. and Nova Scotia 1.0 p.c. Of the two provinces reporting declines New Brunswick suffered a drop of 5.7 p.c. and Manitoba a drop of 1.7 p.c. The following table gives the changes which have taken place in manufacturing during the past ten years, on an industrial as well as a geographical basis.

 Newfoundland and "Publishing (only) of Periodicals" are excluded in columns 1, 2 and 3, but are included in columns 4, 5 and 6.
 Due to the changes of establishments from one industry to another figures for 1949 are not comparable with previous years.
 Exclusive of fish processing.

Consumption of Manufactured Products .- One of the beneficial results of adopting the same classification for external trade and for production is exhibited in Table 6, where the value of commodities made available for consumption in Canada is derived from these statistics. For example, the value of all manufactured commodities made available in 1955 was \$20,152,020,318, a figure obtained by adding to the value of manufactured products the value of the imports of manufactured and partly manufactured goods and deducting the value of the exports. In this table more accurate statistics could be presented were it possible to exclude from the gross value of manufactured products the duplications involved when the products of one manufacturing establishment become the material worked upon in another. Iron, vegetable, wood and paper, non-ferrous metals, non-metallic minerals, textiles and animal products were, in that order, the leading groups in the value of finished products made available for consumption in 1955.

Animal, wood and paper and non-ferrous metal products were manufactured in Canada in greater quantities than required for home consumption, providing export balances in these

On balance, Canada in the past imported large quantities of iron and steel, textiles, chemicals and non-metallic mineral products in spite of large home production. The expansion of the iron and steel, chemical and non-metallic mineral products industries will enable Canada to meet more of her requirements for home consumption and to export greater quantities in the future.

Significant changes have taken place since 1939 in the type of manufactured products made available for consumption. In that year, the iron and its products group was in leading position and contributed 19.8 per cent of the total value of manufactured products. In 1955 this group was still in first place, but the percentage went up to 26.9. The wood and paper products, non-ferrous metals, non-metallic minerals and miscellaneous industries groups also increased their share of the total, while chemicals and allied products remained practically unchanged. The three mineral groups, combined, increased substantially their share of the total from 35.9 in 1939 to 47.4 in 1955. This indicates a higher standard of living for the Canadian people and also reflects the great expansion and diversification in manufacturing which has taken place since 1939. The industries producing consumer goods, on the other hand, suffered a relative decline. Vegetable products dropped from 19.6 to 13.8, animal products from 11.8 to 8.8 and textiles from 13.3 to 8.8. The following table gives the relative position of the major industrial groups in 1939 and 1955.

Manufactured Products Made Available for Consumption

^{1.} Figures for the years 1928-38 are for the fiscal years ended Mar. 31 of the following years: for 1939-55 they are for the calendar year. Not imports are total imports less foreign products re-exported.

2. Consumption figures for the major groups of the Standard Industrial Classification cannot be calculated as statistics of imports and exports are still compiled on the component material classification basis.

3. See footnote 5, table 1.

SECTION 2. VALUE AND VOLUME OF MANUFACTURED PRODUCTS

Value of Manufactured Products.—In the interpretation of manufacturing values over a number of years, variations in the level of prices must be borne in mind. In recent years, due to violent changes in prices, unadjusted value series, used in isolation, have become increasingly inadequate as indicators of economic trends. Of necessity, interest has shifted to measures of volume. The range of prices since 1917, on the base period 1935-39 = 100, was as follows:

Year	General Wholesale	Fully or Chiefly Manufactured Products
1917	148. 9	150.9
19 20	203, 2	208, 2
1929	124.6	123, 7
1933	87. 4	933
19 39	99. 2	101,9
1949	198. 3	199. 2
1953	220.7	228, 8
1955	218.9	224.5

Volume of Manufactured Products.—Since real income is ultimately measured in goods and services, the growth of the volume of manufacturing production, as distinguished from its value, becomes a matter of great significance. The important thing to know is whether consumers are getting more goods and services, and not whether they are expending more dollars and cents. The field of industrial production, because of its dominating position in the national economy, has attracted increasing attention. This, in turn, has resulted in the need for more accurate measurements of physical output.

During the past few years, the Business Statistics Section of the Bureau's Research and Development Division has been engaged in the reconstruction of the Index of Industrial Production. The project consisted mainly of establishing annual gross and net levels of production for each industry from census of industry data and of improving the reliability of the current monthly series. For a description of the methods used in constructing the indexes and a description of its scope, see D.B.S. Reference Paper No. 34 "Revised Index of Industrial Production, 1935-1951".

The construction of this index was made possible by the availability of a great deal of basic data. Annual statistics valuable for this project have been collected by the Bureau without interruption from the end of the first World War to the present, and the scope of the monthly information has been greatly expanded. Applying the methods developed through the experience of the last quarter century, it has been possible to compute an index with a fair measure of accuracy from 1935 to the present.

Prior to the end of the first World War, the movement of industrial production was regarded as following the output of a few factors such as pig iron. The introduction of the index number placed the information on a much wider base. It is safer to base one's impression of the current trend upon a comprehensive index embracing a wide range of economic factors than upon any limited group of components that necessarily fluctuate according to particular influences.

An index of this kind offers considerable advantage in analyzing social and economic problems. The greatest call for the index is for the interpretation of current economic conditions. It is particularly relevant in the study of business fluctuations. While the index is based on the sectors of the economy that are particularly sensitive to short term influences, it also reflects a large part of the variations in the total of all economic activity. The output of mines and factories plays a dominant part in economic fluctuations and is closely associated with transport and trade which are mainly concerned with the distribution of commodities. The barometric nature of the industrial sector enhances the value of the index as an indicator of short-term movements but its usefulness in the interpretation of long-term economic developments should not be overlooked.

The Canadian annual Census of Industry, from which final benchmark indexes are computed, covers practically all establishments, but excludes work in the home. In the matter of repairs, the census of manufactures generally excludes work performed in connection with a service trade such as boot and shoe and automobile repairs. However, the census covers repairs carried on essentially under industrial conditions, such as ship and locomotive repairs. Consequently only industrial-type repairs are included in the index.

The framework of the revised index is based on the new Standard Classification of Industries prepared by an interdepartmental working committee. The preceding system used by the Bureau of Statistics was of a three-fold nature based on (1) chief component material; (2) purpose and (3) origin. The first principle was used most extensively, the criteria of purpose and origin having been used for the presentation of supplementary series which played a secondary role in Bureau publications.

The main innovation introduced in the Standard Classification was the compromise between the different principles. In recent years, Canada's industrial system has undergone considerable development, from a country primarily concerned with the early stages in the processing of primary materials to one that is turning out more and more goods for final consumption. Consequently, in establishing the new classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. The purpose phase was regarded as most appropriate for the wide range of consumer goods such as clothing and foods and beverages.

The industries grouped under the component material phase of the classification from 1935 to 1948 were re-arranged to conform with the standard model. As most of the industries were not greatly affected by the change in classification they were transferred intact to the proper position in the new system. The standard classification, for the most part, provided for comparability at the industry level. It was applied to establishments for the first time in the 1949 census of manufactures. In a number of industries, where the change in classification seriously disturbed the continuity, establishments were re-combined for the whole period covered by the index. The manufacture of synthetic rubber, for example, was transferred from the rubber industry to "miscellaneous chemicals". Plants engaged in the production for distribution of manufactured gas were transferred from "coke and gas" to the gas and electricity division. The salt industry was adjusted so as to comprise only processing operations for inclusion in the manufacturing division of the index. Three minor industries which were reclassified to non-industrial groups were dropped from the computation.

The appropriate series in the manufacturing division were re-classified to obtain sub-indexes of economic significance. The movement of durable goods normally varies from that of non-durables. There tends to be greater fluctuation in durables from prosperity to depression, the demand for non-durables being more constant. The manufacturing division was therefore divided, at the major group level, as between durable manufactures and non-durable manufactures. Although these groupings are rather rough and ready, they are of great use in economicanalysis. The classification into producers' and consumers' goods, attempted in some countries, involves more difficulty as many intermediate commodities have alternate uses, and was not attempted here.

Volume of Production, 1923-35.—The indexes of volume of production, 1923-1935 given in Table 7 below were constructed in the General Manufactures Section of the Industry and Merchandising Division for the years 1923 to 1946. On comparing the index for 1935 given in Table 7 which stood at 87.9 with the new index for 1935 at 86.5 given in Table 8, it would appear that for the back years little significant variation existed between the two series. The indexes in Table 7 may therefore be used in evaluating the changes in the volume of manufacturing production between 1923 and 1935.

The physical volume of manufacturing production increased 50 p.c. from 1923 to 1929. When it is recalled that the population of Canada is estimated to have increased only 11 p.c. during the same period, the growth of manufacturing production is indeed remarkable. Of this advance, the part resulting from an increase in the domestic demand due to growth of population would therefore be about 11 p.c. Exports of partly and fully manufactured goods increased from \$591,830,000 in the fiscal year ended Mar. 31, 1924, to \$686,876,000 in the fiscal

year 1929-30, the increase in exports representing about 3.6 p.c. of the 1923 production. The remainder of the increase in production by 1929, or a margin equal to roughly 35 p.c. of the volume of manufactures of 1923, was, therefore, apparently absorbed by increases in capital equipment and by the rise in the standard of living of the population of Canada. From a high of 101.4 in 1929 the volume of production declined to 67.6 in 1932 and climbed again to 87.9 in 1935.

TABLE 7. Indexes of the Volume of Manufacturing Production, According to the Component Material Classification, 1923-35
(1935-39 = 100)

	Year	Vegetable	Animal	Textiles	Wood and paper	Iron	Non- ferrous metal	Non- metallic mineral	Chemicals	Miscel- laneous	All industries

1935		87.0	91.3	94.5	89.5	83.4	81. 2	88.1	87. 2	91.1	87.9

Volume of Production, 1935-1955.— The period covered by this report was characterized by unprecedented industrial expansion. Emerging from a depression practically world-wide in scope, industrial operations in this country entered a period of rapid growth which was maintained throughout the war and post-war years without important interruption.

A problem confronting business economists is to determine how much of the post-war industrial "drive" was due to normal growth factors and how much of it was caused by the backlog of war accumulated demand. While it is true that the greatest demand accumulation took place in housing and consumer durables, non-durables such as textiles and clothing also started the post-war period with a sizeable backlog of unfilled demand. It is now becoming apparent, after the vigorous pace of business following the outbreak of hostilities in Korea, that a considerable portion of this demand has been satisfied and some industries, notably textiles, clothing, agricultural implements and some major appliances, are experiencing difficulties. However, overall prospects appear bright for the near future. The high level of capital investment during the past few years which increased productive capacity, is beginning to be reflected in current production statistics. Huge expansion and development programmes are still under way in iron ore, aluminum and other metals, oil, chemicals, electric power, and in a number of other industries. In addition, federal government expenditures for national defence should still exert some influence on the economic picture.

The volume of output of manufactures rose steeply after the outbreak of hostilities in 1939. Productive facilities

responded quickly to the urgent requirements of the armed forces. In the early days of the war, production assignments alloted were comparatively simple, but as the pre-war weapons became absolete and as Canada proved herself capable of turning out larger and more complex equipment, the assignments constantly shifted, changed and grew more difficult. The production figures merely suggest the magnitude of the achievement. They cannot describe the tremendous effort needed to convert a semi-agricultural country into a wartime arsenal nor the complications which arose because of shortages of manpower, tools and materials.

The productive peak was reached in 1944, when weapons, supplies and equipment were rolling off the assembly lines at record-breaking pace. The end of hostilities and the subsequent reconversion to peace-time production were attended with declines in output in 1945 and 1946. The upward trend was resumed, however, in 1947. The rate of advance slackened moderately in 1948 and 1945 but regained most of its 1947 impetus in 1950 when the renewal of hostilities in Korea resulted in heavy anticipatory buying on the part of consumers and in growing expenditures for national defence. A remarkable feature is that in 1952, the index of the volume of manufacturing production which stood at 246.3 had surpassed the record wartime level of 242.3 established in 1944. The index continued to advance in 1953, reaching a record high of 263.0. In 1954 there was a minor recession and the index dropped to 251.4. With the upturn in economic activity which occurred in 1955 the index rose again to an all-time high of 270.1, exceeding the previous high of 1953 by 2.7 p.c.

TABLE 8. Indexes of the Total Volume of Manufacturing Production, Classified on the Basis of Durable and Non-Durable Goods, 1935-1955

(1935-39 = 100)

Year	All manufactures	Non-durable manufactures	Durable manufactures
935	86. 5	00.0	00.5
936	95, 5	89.0	82.7
937	1	97, 1	93, 1
	109.3	106.7	113. 2
938	100,6	98.9	103, 2
939	108. 1	- 108.2	107.9
940	134. 4	124, 6	149.7
941	175.9	148.7	218.5
942	215.7	169.4	288.1
943	234, 5	171.5	333.0
944	242. 3	179.8	340.1
945	209.8	176.3	262.1
946	189.9	180. 2	205.1
947	207.7	191, 2	233, 5
948	215.5	197.1	244.4
949	217.0	198.2	246.3
950	228.1	208, 3	259.1
951	242. 1	214.0	285, 9
952	246.3	215, 2	294.9
953	263,0	224. 1	323.9
954	251, 4	221.7	297.7
955	270. 1	235, 2	324.8

Non-durable Manufactures

The trend of output in the non-durable sector of manufacturing was visibly smoother than in the durable sector. Except for three years, 1938, 1945 and 1954, there has been no interruption in the upward movement of production during the period under review. Despite the fact that war contracts quickened the pace of output in some of the industries, production continued to expand after the war, although at a slower rate. Unlike durable goods, non-durable commodities are mostly consumers' goods and are less influenced by sudden changes in the international situation or the capital investment programmes of producers and governments. By 1955 the non-durables index of output had reached 235.2, the highest on record.

The production of processed foods and beverages rose without pause throughout the period. A characteristic of most manufactured foods industries is the high ratio of the value of materials consumed to the value of products, indicating a relatively low degree of fabrication per unit of output. The advance in the production of beverages was practically uninterrupted from 1935 to the present. In 1955, the volume of output was more than 3 times what it was in the base period. The largest increases were recorded in the aerated waters and brewing industries. The indexes of these industries attained levels approaching 414 and 375 in 1955: Wine production, after reaching a peak in 1947, dropped 36 per cent in the following three years. Some recovery was recorded during the next few years and in 1955 the output of new wine was 93 p.c. of the 1947 peak. Output of liquor climbed steadily until 1946 when the index reached 209. During the next four years, the volume of production fluctuated within narrow limits and in 1952 advanced sharply to an index level of 260, with a further rise to 290 in 1953. After declining moderately in 1954 the index rose again to 295 in 1955.

The great demand for cigarettes for members of the armed forces during the war contributed largely to the considerable increase in the **tobacco products** index which reached the record level of 230 in 1945. The index dropped to 204 the following year, but rose gradually thereafter to 228 in 1950. Weakening demand led to a decline of 7 per cent in 1951. Rapid recovery was made during the next four years with the index rising to 303.3 in 1955, highest on record.

The contribution of the "Rubber Products" industry to the war effort was mainly in the form of tires and tubes for military vehicles and aircraft. Production of passenger car tires and tubes was sharply curtailed as was the output of rubber footwear. After marked increases in 1940 and 1941, the index remained more or less stationary at around 150 until 1945 when civilian production was resumed and the index jumped to 180. The industry-wide strike in 1946 contributed to a decline in that year, but record-breaking demand for the industry's output led to sharp advances in the following years, and in 1951 the index had reached the maximum level of 264. During the next few years the index fluctuated moderately and in 1955 climbed to 296.

Output of leather products rose steadily until 1946 when the index reached a high point of 168. The subsequent easing of foreign demand for the industry's products contributed to the gradual decline of production in the post-war period with the result that this group has shown the smallest growth of any in the manufacturing sector. In 1955, volume of output was only 37 per cent greater than in the base period. Production of leather tanneries in 1954 was actually 4.0 p.c. lower than in 1935-39, while the output of boots and shoes was 48 per cent higher. Some recovery was made in 1955, the output of tanneries increasing 10 p.c. and footwear 53 p.c. over the base period. Since 1946 the overall index of this group dropped 19 p.c.

The textile (ex. clothing) industries reached their maximum wartime level of output in 1942 when the net index stood at 187. Production then fell off gradually until 1946 but recovered sharply in the post-war period to an index level of 212 in 1950. A slackening of demand for textiles during the next few years saw the index drop to 188 in 1953, with another sharp drop to 161 in 1954. Of all the industries of the non-durable goods sector, textiles were the hardest hit by the downturn in manufacturing activity in 1954. In 1955 there was substantial recovery and the index which rose to 185 was still, however, some 13 p.c. below the 1950 high. The movement of individual industries within the group has varied over the period. After reaching its highest level in 1942 the production of cotton goods declined steadily until 1947. After varying but fractionally in 1948 and 1949, output jumped 16 per cent in 1950, and remained practically unchanged in 1951, the recession in

the last six months of the year just about offsetting the gains recorded in the first half. With continuing adverse conditions, the index dropped to a post-war low of 115 in 1954. The recovery made in 1955 brought the index up to 136, still some 27 p.c. below the record of 187 attained in 1942. Contributing to the higher level of net output during the period 1940-1943 in this industry was the comparatively sharp increase in production of piece-dyed and printed and painted fabrics which require considerably more processing than ordinary grey fabrics. When output of these two types of cloth declined to more normal levels, the change was reflected in the annual indexes.

Since 1938, the production index for synthetic textiles showed an unbroken record of increases and in 1951 stood at 393. The adverse conditions prevailing in the textile industry generally during the past few years also affected the output of synthetic textiles. By 1954 the index dropped to 290 with an increase to 331 in 1955. Much of the credit for increasing consumer acceptance of synthetics belongs to the achievements of research in improving manufacturing and dyeing techniques and in the development of new combinations of various fibres with a new range of qualities and practical applications.

Synthetic fibres are now being used in the fabrication of a host of commodities such as suitings, overcoatings, blankets, carpets, draperies, upholstery products, tire fabrics, etc., in addition to hosiery, dress fabrics and other women's wear. Moreover, Canadian producers are now supplying the bulk of domestic synthetic raw material requirements which were formerly imported from the United States. As a result, new investment outlays by the industry have increased considerably in the post-war period.

The trend in the physical output of clothing was similar to that of other textiles, the production index reaching a peak of 162 in 1942, then declining gradually until 1945. Since then output fluctuated within narrow limits, dropping to a post-war low of 150 in 1951 and a high of 167 in 1953. The general decline in production in 1954 saw the index drop to 145. The recovery in 1955 was only moderate, the index rising to 149. The industry is now facing keen competition and a more selective retail demand. By improving manufacturing methods and styling, the industry hopes to make available more desirable merchandise at lower prices. Weak demand contributed to a marked decline in the level of new investment in durable physical assets. Funds expended for new plant, machinery and equipment dropped from \$15.7 million in 1949 to an average of \$13.0 million during the next four years. In 1954 and 1955 investment dropped to \$9.5 million per annum.

Production of paper products advanced sharply in the postwar period. The level of the index remained relatively steady from 1941 to 1944, but increased 54 per cent in the succeeding seven years to a record figure of 248. In 1952 the index dropped to 236 and increased to 268 in 1955. Activity in this sector of manufacturing is influenced mainly by the "Pulp and Paper" industry, which, in terms of value added, is the most important single manufacturing industry. In the last few years, the net value contributed by pulp and paper mills was more than twice that of any other industry. The growth of this industry during the period under review was characterized by two distinct phases. From 1935 to the end of the war, new investment by the industry was designed mainly to replace worn-out machinery and equipment and increases in output were principally the result of utilizing idle capacity after the depression of the thirties. Since 1945, however, with strong world demand for wood pulp and newsprint, together with the availability of necessary materials for expansion, the construction of new plant and the installation of new machinery and equipment reached record proportions. Investment in new plant and equipment, which averaged \$105 million during the previous three years dropped to an average of \$70.0 million in 1954 and 1955, a decrease of \$46 million from the record high reported in 1952.

Newsprint, pulp and paper board are the leading products of the pulp and paper industry. Production of newsprint in 1955 totalled 6,196,319 tons of which 5,763,167 tons were exported. Canada is thus the leading exporter of newsprint in the world. World exports of newsprint in 1954 are estimated at 6,788,000 tons, with Canada accounting for 81.3 p.c. of the total. Finland, Sweden and Norway, in the order named, are other substantial exporters of newsprint and between them have accounted for 10.5 p.c. of the total. Newsprint is also Canada's leading export and in 1955 was valued at \$665,876,987.

The printing and publishing industries expanded very little during the war years. In 1944, output was only about 15 per cent greater than in the base period. Production grew rapidly, however, after the end of hostilities and in 1955, volume of output was more than double what it was in the five pre-war years, although this represents a substantially smaller advance than total manufacturing. The post-war increase coincided with the gain in the value of new investment which was mainly in the form of machinery and equipment to make up for deficiencies dating back to the depressed thirties and the war years. Investment in fixed assets totalled \$16 million in 1953 and \$28 million per annum in 1954 and 1955 as compared with only about \$2 million in 1944.

With few interruptions, output of petroleum and coal products rose steadily over the period under review to an index of 385 in 1955. Although production of coke failed to exceed its record wartime volume, petroleum refining, as the result of record-breaking post-war demand for gasoline and fuel oils. showed a marked expansion. In 1955, the production index stood at 475 compared with a wartime high of 170 in 1944. In recent years, the industry has added substantially to its refining capacity. From 1947 to 1951, expenditures for new plant, machinery and equipment which averaged more than \$37 million a year rose to \$84 million during 1952, 1953 and 1954 and to \$109 million in 1955. Some of this rapid growth is associated with the remarkable progress made in the exploitation of western crude oil reserves. In 1955, oil from domestic wells represented 56 per cent of the total consumed by Canadian refineries. This compared with a contribution of 22 per cent in 1949.

Output of chemical products which include ammunition and explosives reached a record-high level in 1944 when the index stood at 390. Production in the post-war period has been at a considerably lower level, but increased significantly since 1950, with the advent of the defence programme. The index in 1955 stood at 292. The expansion of the industry during the war made possible the manufacture of many products which were formerly imported. In addition, several entirely new products, such as synthetic rubber, were introduced. Demand for these commodities continued in the post-war period and the development of new sources of basic materials, together with the progress of research into additional commercial uses for these new compounds resulted in further expansion of production for civilian use.

The rapid wartime advance was mainly the result of the enlargement of the munition programme with the government and private industry combining forces in the construction of a huge explosives and ammunition-filling industry. At its peak in 1943, the production index for explosives and ammunition was 20 times higher than in the base period. Output dropped very rapidly after the end of the war and in 1946 the index was down to 107.

Since the Government-owned Polymer Corporation began producing synthetic rubber in 1943, output of this important commodity has expanded considerably, to a total of 115,000 tons in 1955. Production declined somewhat in 1947 and 1948 when imports of natural rubber were resumed, but recovered strongly to record levels since 1950, as the defence programme gathered momentum and as the rubber requirements of the motor vehicles industry rose to a new maximum. During 1955, synthetic rubber accounted for 46 per cent of total new rubber consumed in Canada. This commodity is classified to the "Miscellaneous Chemicals" industry.

TABLE 9. Indexes of the Volume of Manufacturing Production of the Groups Comprised within the Non-Durable Manufactures Classification, 1935-1955

(1935-39 = 100)

					Non-d	urable manu	factures				
Year	Foods	Beverages	Tobacco and tobacco products	Rubber products	Leather products	Textile products (except) clothing)	Clothing (textile and fur)	Paper products	Printing, publishing and allied trades	Products of petroleum and coal	Chemicals and allied products

Durable Manufactures

The tremendous increase in physical output during the war years was mostly concentrated in the durable goods sector. When war was declared in September, 1939, there were virtually no armament works, no production of large ships and large planes, no guns, no tanks. Within a few years Canadian plants were turning out naval and merchant ships, warplanes ranging up to the 15-ton Lancaster bomber, military vehicles, millions of rounds of ammunition and hundreds of other war items. On the base of 1935-39 the new volume index of durable manufactures reached a peak of 340 in 1944. In the following two years it declined sharply and stood at 205 in 1946. Since then it has almost regained the lost ground, and reached 325 in 1955, only 4.5 p.c. below the war-time peak of 340.

The largest gain occurred in the output of transportation equipment. Due principally to the tremendous increases in production of ships and aircraft, the index for this group of industries rose to the record level of 694 in 1944, the year of maximum war production. After reaching a post-war low of 222 in 1946, the index rose moderately during the next three years, but, spurred by the great demand for passenger cars and by the renewal of defence production, marked gains were made since 1950, with the index climbing to 436 in 1953. The minor recession in industrial production in 1954 affected this group more than any other. The index dropped to 355, a decline of 18.7 p.c. as compared with the previous year. In 1955 there was another minor decline with the index dropping to 351. This was the only group to report a lower volume output in 1955.

The iron and steel group of industries was also considerably affected by war requirements. As most of the industries in this sector were more firmly established in the pre-war period, they did not expand relatively to the same extent as shipbuilding and aircraft. When European supplies were cut off early in the war, the Canadian basic steel industry had to rely

on the United States for a greater supply and had to increase its own steel-making capacity to meet abnormal wartime requirements. However, development of the industry did not halt with end of hostilities. Canada's industrialization programme. together with strong post-war demand for consumers' durable goods, led to steady expansion of the industry so that by 1953, the index for the group stood at 291. Compared with pre-war, pig iron output had more than tripled, and steel ingot and casting production had risen by 170 and 74 per cent respectively. Due to the contraction in the demand for durable goods in 1954 the index for the group dropped to 252, down to about the 1947 level. Pig iron at 2,211,000 tons was down 27 p.c. and steel ingots at 3.195,000 were 22 p.c. lower. However, rapid recovery was made in 1955 when the index rose to 287, only a few points below the record high of 293 attained in 1952. Production of pig iron in 1955 totalled 3,215,000 tons and steel ingots and castings 4,535,000 tons. The additional capacity constructed during the past few years should reduce still further the country's dependence on United States imports of finished and semi-finished iron and steel shapes. Indicative of the rapid growth of the industry in recent years is the amount of funds expended for new plant, machinery and equipment, From an average annual expendition of \$62 million during the previous five years new investment jumped to \$136 million in 1952 and \$114 million in 1953. New investment in 1954 amounted to \$88 million and in 1955 to \$95 million.

To meet the need for electrical and radar equipment and signalling devices, the "Electrical Apparatus and Supplies" industry manufactured articles during the war which were previously not made in Canada. Output of civilian radio receiving sets and appliances was severely curtailed as the industry converted the major part of its productive capacity to the manufacture of war instruments. The production index reached a wartime peak of 312 in 1944 and declined during the next two years. The industry recovered rapidiy, however, as a result of accumulated demand for radios, consumers' appliances and

heavy electrical equipment, and by 1952 the index had jumped 60 per cent from its 1946 post-war low, to a level of 393. Due mainly to the heavy demand for television sets, the index in 1953 advanced sharply to 487 an increase of 24 per cent over the previous year. In 1954 the index declined moderately to 478, but rose sharply in 1955 to an all-time high of 535.

Production in the non-ferrous metals group of industries reached a wartime maximum in 1943 when the net index stood at 285. During the next three years, output dropped 44 per cent, but recovered steadily thereafter, backed by sustained demand for base metals. In 1955 the index stood at 271. Aluminum which is an important component of the group is being fabricated into an ever-increasing variety of commodities, and production of aluminum bars and rods, sheets, shapes, etc., reached record proportions in the post-war period. During the war years, aluminum sheet production was of a strong alloy type used principally in aircraft construction and required more fabrication than the regular type of sheet used in the production of cooking utensils and other civilian items.

Military requirements did not affect the nature of output in the non-metallic mineral products group of industries. In war or peace, the bulk of production consists of construction materials such as cement, cement products, building brick, lime and gypsum products, glass, stone products, etc. During the war, under government control, a major proportion of these industries' products were channelled into construction of new war production plants, extensions to pre-war plants, housing for war workers and the building of training and operation facilities for

the armed services. No serious reconversion problems were encountered by the non-metal industries immediately following the war. After a slight pause, following the peak of wartime output, plants turned their productive capacity towards meeting the unprecedented demands of the post-war construction boom. From a wartime maximum of 212 in 1943, the volume index dropped moderately in 1944 and 1945, but rose steeply in succeeding years to reach the record level of 471 in 1955.

In the durables sector, the wood-using industries were the least affected by the war. The volume of output of wood products expanded steadily without any serious interruption throughout the war and post-war years. In 1953 the index stood at 235. the highest on record. In 1954 the index declined fractionally to 230, but advanced sharply the following year to an all-time high of 255. The two most important industries are "Sawmills" and "Furniture". The index representing the former, after reaching a wartime maximum of 140 in 1942, declined considerably in 1943, and hovered around 124 during the next two years. Beginning in 1946, output rose sharply, spurred by strong foreign and domestic demand for sawn lumber and by 1951, the index had advanced to 168, but declined to 164 in 1952, Considerable improvement took place since then with the index advancing to 199 in 1955. Production in the furniture industry expanded throughout the period under review. The great increase in residential construction in the post-war period, together with the marked gain in new family formations created a boom for producers of house furnishings. Output of furniture jumped sharply in the three years immediately following the end of the war and rose more gradually during the subsequent period.

SECTION 3. PRODUCTION BY INDUSTRIAL GROUPS AND INDIVIDUAL INDUSTRIES

Subsection 1. Manufactures Grouped on the Standard Classification Basis

Three important changes have been made during the past few years in the methods of collecting and compiling the returns of the annual survey of manufactures. First was the adoption in 1949 of the Standard Industrial Classification, This new classification superseded the classification formerly used by the Bureau, which was based on the nature of the materials used by manufacturing establishments.

For most purposes, a classification of manufacturing industries based upon "chief component material" has in the past proved most useful in Canadian industrial classification, The Bureau's classification based on this concept has been the one most widely adopted for general purposes, such as the decennial census, foreign trade, industrial statistics, etc. Even for these purposes some modification has been deemed expedient, such as the inclusion of such a group as "Textile Products" comprised partly of animal and partly of vegetable products.

When the industry of a country is primarily concerned with the early stages in the processing of primary materials, which form final products such as pig iron, lumber or processed fish, a classification based upon chief component material is wholly applicable. As manufacturing industry develops, however, turning out more and more goods for final consumption, the combination of ingredients in such production becomes more and more complex. The modern automotive, aircraft, shipbuilding and electrical apparatus industries are examples in which a wide variety of materials must be assembled for the compilation of the final product. For this reason, the application of the component material classification became increasingly more difficult as Canadian manufacturing production developed and diversified.

In establishing the Standard Industrial Classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. For the classification of consumers' goods industries, the concept of "purpose" seems most applicable both in terms of common usage in referring to industries and in providing the type of data most often required. Hence, such major groups as Foods and Beverages, Clothing, Transportation Equipment, Electrical Apparatus and Supplies, have been established. Some industries were broken down, such as the electrical apparatus and supplies which now comprises five industries - (a) batteries, (b) heavy electrical machinery, (c) radios, television sets and parts, (d) refrigerators, vacuum cleaners and appliances, and (e) miscellaneous electrical products. In some cases, establishments were transferred from one industry to another in order to bring them in line with the new industries which were established. Where an industry was eliminated, the establishments were transferred to one or several industries, depending on the nature of the principal products manufactured. A check was also made of all establishments and many transfers were made where the major products of the establishment had changed materially during the years. By and large, little change was required for most industries, the only change being a transfer to the new major groups which were established.

In the Standard Classification adopted in 1949 the industries are now grouped into seventeen major groups listed in Table 11, instead of the nine groups listed in Table 13 which were formerly used as the main basis of classification. The grouping used in Table 11, where the statistics of individual industries are presented in detail, and in the historical series shown in Table 3 is, therefore, on the basis of the new Standard Industrial Classification. However, to retain some basis of continuity with the past, there is a less detailed analysis given in Table 13 on the component material classification basis, while Table 14 gives the industries on the basis of the origin of the materials used.

The second major change was the adoption of the short form in 1949, which goes a long way in relieving small manufacturers from the irksome duty of filling in complicated and detailed returns to the Bureau.

The growing complexity of modern economic life compels governments to obtain more and more data on which to base their economic policies and for the efficient discharge of their responsibilities in the ever-widening field of activity. To get this information is expensive and also throws a burden on industry in general, which of necessity must be called upon to furnish the desired data. Realizing this, and also the fact that the necessary information must be secured, the Bureau has been casting about for new statistical techniques which would lessen the burden on industry and also would, at the same time. secure substantially correct data for the use of the administrator. With manufacturing statistics, unfortunately, the sampling techniques are difficult to apply. Other methods, therefore, had to be adopted in order to lessen the burden of the smaller manufacturer at least and, at the same time, secure substantially correct results. It was found, for example, that in 1949 out of 35,792 manufacturing establishments, 21,060 with a value of production of \$50,000 or less, contributed only 2.6 p.c. of the total value of production. On the surface it looked obvious that the Bureau could exempt these 21,000 establishments from making annual returns and still obtain satisfactory results. This would be true if we were only interested in the total value of production or the total value of materials used. This, however, is not the case, as the users of the statistics are also interested in the details of the products made and the materials used. By a study of each industry it was found that by exempting the smaller establishments in some industries. that for some commodities produced or materials used there would be a 50 p.c. loss of the total. Complete exemption was therefore out of the question. New methods had to be designed to relieve small establishments of the difficult task in furnishing information. A study was therefore made of each industry classification, of which there are about 200, and different cutoff points were determined for different industries. The general rule adopted was that wherever possible establishments with a value of production of less than \$50,000 per annum should only be required to furnish that one figure to the Bureau, and that on the basis of the information received from the smaller establishments in 1948, the last year for which they were required to furnish complete details, the Bureau would estimate for each small establishment individually the number of employees. salaries and wages paid, as well as the value of materials used. This is done in order to have a hollerith card for each establishment to use in the compilations on a geographical basis. In addition to the principal statistics, details of materials used and products made by the short-form firms are also made for each industry, by province, These estimates are based on the detailed statistics supplied by the small establishments in 1948. These estimates cannot be far out, as in most industries the percentage that these smaller establishments contribute to the total for the industry is only from 10 to 20 p.c. Where it was found that there would be a great loss in commodity data, instead of asking only for the gross value of production, the smaller firms were required to fill in a shorter form which lists the commodities in which there would be a substantial loss if no information was obtained from small firms. In other cases the cut-off point was reduced to \$25,000 or \$15,000.

An important change was made in the annual census of manufactures for 1952. A shipments concept instead of the value of production statistics heretofore compiled was adopted for a large number of industries where it was known that inventory changes from year to year were only of a minor nature. The concept was not changed for industries known to experience wide fluctuations in inventory holdings, pending further study for the need of both production and shipments information. By 1954 the shipments concept was implemented for almost all industries, Industries for which production statistics are still

required are asked to report the detail of products made in physical quantities only and at the same time are required to report details of their shipments, giving both the quantity as well as the selling values at the plant. In a few industries such as sawmills, veneer and plywood, etc., production statistics only are still collected, the products made being valued on the basis of average selling prices during the current year.

The aim of the new Census of Industry schedule is to ease the burden of filling out Bureau questionnaires. The value of shipments concept for small and medium sized establishments is more realistic and more readily obtainable from the accounting records of firms, whereas the value of products made, for firms not recording such information, must be derived from special calculations. The value of shipments provides a standard basis of reporting for all establishments. Under the old system some establishments reported the value of products made and others the value of factory shipments, even though the schedule required products made to be reported. This was especially true for small and medium sized establishments. Further, a great number of firms, attempting to report production values to fulfil the requirements of the old questionnaire, in fact computed their cost of production rather than their selling value, as they were supposed to. Since the value of shipments is usually carried in the firm's accounts, the work of filling out reports should be lessened and the questionnaire should as a result be filled out more promptly. The change should ease the burden for small establishments in particular, since the value of sales is readily available from their accounting records.

Under the "value of products" concept, establishments were required to report the factory selling value of the products made, whether sold or not, the unsold portion being assigned the average selling value of similar articles sold during the year. Where no selling values were available for the unsold portion estimated values had to be assigned. Under the new concept establishments are required to report their sales during the year, regardless of when the products were made.

These two concepts give different results, the first gives the value of products made and the second the value of products sold. For a large number of industries where normally there is no significant changes in the opening and closing inventories of finished products, these two sets of figures may be used interchangeably as they both reveal more or less the value of production and are, therefore, comparable with figures for previous years. There are, however, a number of large key industries with substantial changes in their opening and closing inventories, in such industries the new concept gives quite different results to that obtained formerly. To get comparable figures, the shipments figures must be converted to a production basis by adjusting for inventory change.

The change to the new concept solved the problem of uniformity of reporting inasmuch as the smaller firms who previously were reporting shipments instead of production are now reporting correctly. However, the new method has created other problems. One of these is the calculation of "value added by manufacture," which is obtained by subtracting from the value of production the cost of materials used, including the cost of fuel and electricity. Since the value of production is not now being reported, it has to be calculated by using the following formula.

'Shipments plus closing inventory of finished products minus the opening inventory of finished products equals value of products made.' In order to enable the Bureau to calculate "value added," it became necessary to ask firms to report their opening and closing inventories, broken down into (a) raw materials, (b) goods in process, and (c) finished products. These questions were added to the form for the 1954 census. As the schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added by manufacture is obtained by subtracting from the shipments the cost of materials used, including fuel and electricity.

In theory, adjustment should also be made for the change in work in process inventory, and ideally the inventory adjustment should be on a "value of the physical change" basis rather than the "change in book value." However, it has not been possible to introduce these refinements at the present time.

Another difficulty has arisen in implementing the shipments concept in the case of multiple unit firms that ship the products from the various plants to a central warehouse, located in another city, where the selling function of the firm is performed. In such cases the goods leaving the plant are considered as being shipments under our definition even though the ownership still remains with the reporting firm, Such firms are considered as performing two distinct functions - (a) manufacturing, and (b) distributing - and these two functions are treated statistically as if they were performed by two different organizations. In many cases no stock is held at the plant; consequently shipments and production reported on a plant basis are one and the same. We therefore are still getting production figures from firms that sell from a central warehouse. Where the manufactured products are billed to the warehouse, the firm is required to report the total of such billings during the year. In some cases the production and distribution functions are treated in the accounting records as a unified operation, no charge being made to the warehouse of the products shipped. In such cases firms are instructed, if possible, to report the shipments on a cost of production basis, with a percentage mark-up for profits. The aim of the Division is to get companies to report their shipments on the same basis as if they were selling to an independent wholesaler.

Having received a return from all manufacturing establishments and the value of their products totalled, the question now is "What does this total mean?" The truth of the matter is that a total value of production for a group of industries or all industries for a single year has no significant meaning. To add the value of production of flour mills to that of the baking industry would give an inflated value of production since part of the flour which was sold to bakeries is valued twice, first as a product of flour mills and again in the cost of bread. For example, if a flour mill would produce \$1,00 worth of flour and sell it to a baker, the baker would use this dollar's worth of flour, and after further processing would sell it for \$2.14 according to the experience of the baking industry for 1954, According to the statistics obtained for that year for every dollar's worth of materials used the products made were valued at \$2.14. When you add the production of these two establishments, you get a value of \$3,14. There is thus duplication where the products of one establishment become the raw materials of another establishment. However, in the present issue, the totals of gross value of production or shipments are shown as a matter of historical interest.

A more meaningful indicator had to be evolved to measure the importance and wealth created by an industry or group of industries. This was found in the concept "value added by manufacture." This figure is obtained by subtracting the cost of fuel and electricity as well as the cost of materials used from the gross value of the products, and represents the values added to the raw materials while they are in the factory, Such added values constitute the real production of the manufacturing plant and are alone available for the payment of salaries and wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met, as well as profits. The value added by manufacture reported by the various industries can be added to produce a non-duplicating total for manufacturing as a whole. Being free of duplication, within the manufacturing sector value added figures are therefore more representative of the total value of manufacturing production than the gross value of production figures.

The concept of "net value" is also important in evaluating the importance of an industry as a creator of economic wealth. Usually the gross value of production is used in ranking industries. This method has the defect of overevaluating industries that use expensive raw materials which undergo little processing. The following table ranks the fifteen leading industries in 1954 on the basis of "gross" and "net" value of production.

	Selling v	value of hipments	Value a manuf	dded by acture
	Amount	Rank	Amount	Rank
	\$'000,000		\$'000,000

Printing and publishing	256, 7	15	182. 9	6

In interpreting the statistics of individual industries, it should be remembered that the figures on employment, production, etc., do not refer to individual products but to all the products made in an industry. For example, the value of production of the confectionery industry, amounting to \$104,853,748 in 1950, does not imply that this was the value of confectionery produced. What it means is that the firms whose principal product is confectionery had a value of production of \$104,853,748. This figure, in addition to confectionery, includes all the subsidiary products made by these firms such as ice cream which was valued at \$2,214,689 and bread and other bakery products valued at \$2,457,312. Confectionery is also

produced as a subsidiary product by firms credited to other industrial classifications. For total production figures of individual products, reference should be made to "The Alphabetical List of Products" published annually as Appendix II to this report.

Table 11 presents for the year 1955 detailed statistics regarding the individual industries under which all industrial plants in Canada are classified. The industries are further assembled under seventeen main groups according to the Standard Industrial Classification.

Table 12 gives the amount and value of each of the principal commodities produced or shipped by the manufacturing industries of Canada, Commodities produced in small quantities

are not included but the list covers approximately 75 p.c. of total production. For a complete list of products, see Appendix II of this report.

TABLE 12. Quantities and Values of the Principal Commodities Produced or Shipped by the Manufacturing Industries of Canada, 1955

Note: Since 1952 the basis of collection is "Value of Factory shipments" instead of "Gross Value of Products". However, the commodities marked are still on a production basis.

Subsection 2. Manufactures Classified on the Chief Component Material Classification Basis

For the most purposes a classification of manufacturing industries based upon "chief component materials" has, in the past, proved most useful in Canadian industrial classification. For this reason the Bureau's classification based upon this concept has been the one most widely used for general purposes such as the Decennial Census, Vital Statistics, foreign Trade, etc. Even for these purposes some modification has been deemed expedient, such as the inclusion of a group "Textile Products", composed partly of animal and partly of vegetable products.

When the industry of a country is primarily concerned with the early stages in the processing of primary materials, i.e., when its final products are chiefly such items as pig iron, lumber and processed fish, a classification based upon chief component material is wholly applicable. As manufacturing industry develops, however, turning out more and more goods for final consumption, the combination of ingredients in such output becomes more and more complex. The modern automotive, aircraft, shipbuilding, and electrical apparatus industries are examples in which a wide variety of materials must be assembled for the completion of the final product.

In recent years Canada's industrial system has undergone considerable development, Consequently in establishing the Standard Industrial Classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries, For the classification of consumers' goods industries the concept of "purpose" seems most applicable both in terms of common usage in referring to industries and in providing the type of data most often required. Hence, such major groups as Foods and Beverages, Clothing, Transportation Equipment, Electrical Apparatus and Supplies, have been established.

TABLE 13. Principal Statistics of the Manufacturing Industries, Classified on the Chief Component Material Classification Basis, by Main Groups, Significant Years, 1917-1955

Industriąl group and year	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Gross value of products

1. In 1952 the basis of collection was changed from "value of products made"to" value of factory shipments" - See text on pages 8 and 25.

Subsection 3. Manufactures Classified by Origin of Materials

The distinction made between farm materials of Canadian and foreign origin is based on whether the materials are indigenous to Canada rather than on their actual source. Thus, the industries included in the foreign origin classes are those depending upon materials that cannot be grown in Canada, such as tea, coffee, spices, cane sugar, rice, rubber, cotton, etc. Industries included in the Canadian origin classes may, however, be using large quantities of imported materials.

The mineral origin group includes, in addition to nonferrous metals so largely produced in Canada, the manufactures of iron and steel, or petroleum, and of other mineral substances, the raw materials for which are very largely imported. Products of mineral origin, with the exception of fuels, are nearly all durable goods. A high standard of living and advanced industrial organization is usually indicated by a relatively large production and consumption of mineral products. During periods of depression when the production of capital goods is curtailed, employment in the industries of the farm group, which produce mainly consumer goods, exceeds that of the mineral group. The industries of the mineral group in 1943, at the maximum of the war effort, had by far the greatest capital investment, employed the largest number of persons, and paid out the highest amount in salaries and wages. In 1943 the average capital per employee amounted to \$5,441 for the mineral group as compared with \$4,417 for the farm origin group. The mineral group also pays the highest wages. In 1955 the average salary and wage was \$3,661 for the mineral group and \$2,720 for the farm origin group.

^{1.} For the year 1924 the figures for "Cost of Materials" and "Gross Value of Products" include the value placed on intermediate products used in further processes in the chemical group of industries. For this reason these figures differ slightly from those contained in the other tables of this report.

2. In 1952 the basis of collection was changed from "Value of Products Made" to "Value of Factory Shipments". See text on pages 8 and 25.

Subsection 4. Manufactures Classified by Type of Ownership

The present report deals with the type of ownership under which Canadian manufacturers operate. The first survey in 1946 did not include the fish-curing and packing industry, information for which was not available at that time. For this reason the figures for 1946 are not strictly comparable with those for succeeding years, although the inclusion of that industry has not materially altered the percentage distribution of individual ownership, incorporated companies, etc.

Of the 38,182 establishments operating in 1955, 1,617 establishments in the periodical publishing industry were unclassifiable, leaving 36,565 establishments in the four categories

of ownership. Individual ownership numbered 15,609 establishments, partnerships 4,977, incorporated companies 15,037 and co-operatives 942. The percentage distribution of the four categories of ownership are given below for the years 1946 to 1955. It is interesting to note that incorporated companies are becoming increasingly important, the percentage of the total number of establishments having risen from 33.4 in 1946 to 41.1 in 1955, while the other three categories declined in importance. This trend to incorporation is no doubt accentuated by the favourable income tax rate allowed companies on the first \$20,000 of income.

Year	Individual ownership	Partnerships	Incorporated companies	Co-operatives
1946 (estimated)	47.3	16.0	33.4	3.
1947	46.4	16.1	34.3	3.
	46.2	16.4	34.4	3.
1949	46.0	15.8	35.3	2.
950	45.6	15.0	36.3	3.
951	44.6	15.5	36.9	3.
952	44.9	15.4	36.9	2.
953	44.4	14.8	38.2	2.
954	43.6	14.3	39.5	2
955	42.7	13.6	41.1	2

As is to be expected, the smaller establishments, regardless of the type of products manufactured, are carried on under individual ownership. In that category industries conducted

on a small scale contain a large number of establishments, the percentage decreasing as the scale of operations increases, as the following statement shows.

No. Group	Average number of employees per establishment	Percentage of individual ownership establishments to total
Wood products Printing, publishing and allied industries Miscellaneous manufacturing industries Foods and beverages Non-metallic mineral products Clothing Chemicals and allied products Leather products Iron and steel products Textile mills Knitting mills Non-ferrous metal products Paper products Paper products Paper products Paper products Paper forducts Paper forducts Tobacco and tobacco products Transportation equipment Rubber products Rubber products All groups	11.3 15.5 20.7 22.1 33.3 33.9 46.1 47.3 62.8 70.8 73.2 91.8 154.7 162.9 164.9 170.2 221.9 267.2	60.1 43.6 35.6 46.4 32.2 27.1 16.7 26.6 24.8 30.0 15.2 24.8 7.9 7.7 1.9 35.7 27.9

It is therefor found, according to the above, that in the wood products group 60 p.c. of the establishments were under individual ownership. The foods and beverages group had 46 p.c. of its establishments in this classification, followed by the printing, publishing and allied trades with 44 p.c., tobacco and tobacco products 36 p.c., miscellaneous industries 36 p.c., non-metallic mineral products 32 p.c., textiles 30 p.c., transportation equipment 28 p.c., clothing 27 p.c., leather products 27 p.c., iron and steel and non-ferrous metal products 25 p.c. etc. The petroleum and coal products group with only 1.9 of the total had the smallest number of establishments operating under individual ownership.

The establishments operating under individual ownership are not as important, from the point of view of employment provided, as their large numbers would indicate. According to tables 15 and 16, these establishments which comprise 43 p.c. of the total have only 5 p.c. of the total employees. Partnerships accounted for 14 p.c. of the number of establishments and 3 p.c.

of the total employees. Incorporated companies with 41 p.c. of the number of establishments had 91 p.c. of the employees. Co-operatives with 3 p.c. of the establishments had 1 p.c. of the employees.

On the basis of employment provided, incorporated companies are, by a wide margin, the most important factor in the employment field. In the petroleum and coal products group practically 100 p.c. of the employees were reported by such companies, while the electrical apparatus and supplies, rubber, paper and transportation equipment groups had 99 p.c. Companies in the chemicals, tobacco and non-ferrous metal products groups had 98 p.c., iron and steel products 96 p.c., textiles 95 p.c., kintting mills 94 p.c., non-metallic mineral products 93 p.c., leather products 90 p.c., miscellaneous industries 88 p.c., printing, publishing and allied trades 86 p.c., clothing 83 p.c. and foods and beverages 82 p.c. Companies in the wood products group with 73 reported the lowest percentage of the total employment.

Subsection 5. Leading Manufacturing Industries

In the following statement, the rank of the ten leading industries in 1955, from the standpoint of gross value of pro-

duction, is compared with their respective ranks in significant years since 1922.

	Rank in								
Industry	1955	1949	1944	1939	1933	1929	1922		
Pulp and paper	1	1	5	2	1	1	2		
Non-ferrous metal smelting and refining	2	3	2	1	2	9	1		
Petroleum products	3	5	14	6	6	10	9		
Motor vehicles	4	4	7	5	11	4	6		
Slaughtering and meat packing	5	2	1	3	3	2	3		
Sawmills	6	6	11	8	14	5	4		
Primary iron and steel	7	8	13	11	31	16	20		
Butter and cheese	8	7	10	4	5	6	5		
Aircraft and parts	9	1	4	1	1	1	1		
Miscellaneous electrical apparatus and supplies	10	19	2	2	2	2	2		

Did not rank among the forty leading industries that year.
 This industry was not classified separately but was included with electrical apparatus and supplies.

A prominent feature of Canadian Manufacturing development during the past twenty-five years has been the rapid growth of non-ferrous metal smelting. This industry, based upon the rich base-metal resources of the country, has taken its place among the leading manufactures, along with the industries based upon forest, agricultural and live-stock resources. Another feature of this development in manufacturing production is the rise of the petroleum products industry from fourteenth place in 1944 to third place in 1954 and 1955. This is the direct result of the recent discoveries and development of the large oil resources of the Prairie Provinces and the rapid industrialization of Canada during the past decade.

The incidence of the depression resulted in a re-arrangement of the ranking of many industries which in some cases has proved to be temporary. During the war, the industries engaged in producing the equipment needed by the armed forces, such as shipbuilding, aircraft, automobiles, miscellaneous chemical products, and primary iron and steel, advanced to higher positions. When the war ended, the industries engaged in the production of consumer goods, by reason of the expanded demand for their products, bettered their position. Pulp and paper, after a lapse of a number of years, resumed its premier position.

The impetus given to Canadian manufacturing production by the Korean war is reflected in the advance of the aircraft

industry to ninth position. This industry which did not rank among the forty leading industries before World War II was in fourth place in 1944 and sixteenth place in 1952. The ship-building industry also bettered its position as a result of the defence program occassioned by the Korean war. This industry which did not rank among the forty leading industries in 1949 advanced to thirty-fourth place in 1952 and 1954. With the slackening in defence spending, operations declined with the result that in 1955 this industry, again, did not rank among the forty leading industries.

The recovery in 1955 from the minor recession experienced in 1954 resulted in some major changes in the ranking of the ten leading industries. Volume output of the durable goods industries advanced by 9.1 p.c. as compared with 6.1 p.c. for non-durable goods. This accounts for the advance of motor vehicles from fifth to fourth place, primary iron and steel from eighth to seventh place, and miscellaneous electrical apparatus and supplies from thirteenth to tenth place. Pulp and paper retained its premier position, while non-ferrous metal smelting and refining, petroleum products, sawmills and aircraft ranked the same in 1955 as they did in 1954. Slaughtering and meat packing dropped from fourth to fifth place and butter and cheese from seventh to eighth place.

SECTION 4. PRINCIPAL FACTORS IN MANUFACTURING PRODUCTION

The subjects treated under this Section include capital, employment, salaries and wages, size of establishments and power and fuel used in manufacturing.

Subsection 1. Capital and Repair Expenditures

Prior to 1944 the following information on capital investment was collected: Fixed Capital—Land, buildings, fixtures, machinery, tools and other equipment. Working Capital—(1) Inventory value of raw materials, stocks in process, fuel and miscellaneous supplies on hand; (2) Inventory value of finished products; (3) Cash, bills and accounts receivable, prepaid expenses, etc. This was replaced by the collection of statistics on the expenditure on fixed capital and repairs.

The remarkable increase in capital employed in Canadian manufactures from the beginning of the twentieth century has, of course, run parallel with the rapid growth in industrial operations. From 1900 to 1905 the capital increased from \$446,900,000 to \$833,900,000 and advanced to \$1,958,700,000 in 1915. During this period returns were received from establishments with 5 hands or over, and, while the rise in wholesale prices did not exceed 37 p.c., the capital employed in manufactures increased nearly 340 p.c.

Capital expenditures by manufacturers in 1955 totalled \$344,500,000 for construction and \$601,800,000 for machinery

and equipment, while \$513,600,000 went for repairs. Of the total capital expenditures, amounting to \$946,300,000 in 1955, 14.7 p.c. was reported by paper products, 11.5 p.c. by products of petroleum and coal, 11.0 p.c. by foods and beverages, 10.1 p.c. by iron and steel products, 8.9 p.c. by non-ferrous metal products, 5.9 p.c. by chemicals and allied products, 5.7 p.c. by transportation equipment, 5.0 p.c. by non-metallic mineral products, etc.

Of the groups reporting capital expenditures of \$25,000,000 or more in 1955 seven reported increases and four reported decréases. Of the groups reporting increases paper products with \$51,400,000 led the list, followed by non-ferrous metal products with \$30,300,000, chemicals and allied products \$16,500,000, products of petroleum and coal, \$15,400,000, wood products \$10,000,000, iron and steel products \$6,800,000, and non-metallic mineral products \$4,300,000. The largest decline of \$10,900,000 was reported by the transportation equipment group, followed by electrical apparatus and supplies with \$3,400,000 and foods and beverages and textiles each with \$400,000

Variation in Capital Expenditures 1955 Compared with 1954

All groups	946.3	822.1	+ 124.2	

Capital expenditures in 1955 increased by \$124,200,000. This compared with declines of \$146,900,000 in 1954 and \$3,600,000 in 1953. These declines were preceded by an increase of \$180,000,000 in 1952 and \$290,100,000 in 1951. The following table gives the capital expenditures of the groups in 1955 reporting \$25,000,000 or more, together with the expenditures of these groups in 1954.

Expenditures on capital assets which averaged \$834,000,000 during the past six years reflect the expansion and modernization which the manufacturing industries of Canada have experienced. Although the expansion was at a rapid rate, not all provinces, however, shared in this expansion at an equal rate. Newfoundland had relatively the highest capital expenditures of any province, the percentage of capital expenditures to the

value of factory shipments during the period 1950-54 being 11.0, more than double the Canada average. Alberta with 10.7 was in second place and British Columbia with 7.3 was in third place. Ontario and Saskatchewan equalled the Canada average of 4.9, while Prince Edward Island, Nova Scotia, New Brunswick, Quebec and Manitoba were below this figure.

Some changes in the pattern of capital expenditures was reported in 1955. Alberta with 9.6 p.c. was in first place, displacing Newfoundland from the premier position. In addition to Newfoundland, Alberta and British Columbia, Nova Scotia in 1955 also reported capital expenditures in excess of the Canadian average. Manitoba equalled the Canadian figure, while Prince Edward Island, New Brunswick, Quebec, Ontario and Saskatchewan were below it.

Comparison of Capital Expenditures with Value of Factory Shipments, 1950-1955

Subsection 2. Value of Manufacturing Inventory

As explained in the section on Capital Employed, the collection of statistics on capital investment by manufacturers was discontinued in 1944. This was replaced by the collection annually of expenditure statistics on fixed capital, repairs and maintenance from all large manufacturers, with estimates being made for the smaller establishments. As a result of this change no information was available on investment in inventory. Before long, however, the need for this information became apparent. Consequently, beginning with 1949, calendar year-end inventory values were collected separately from all manufacturing plants with an annual gross value of production of \$50,000 or over. These values are inflated to a total by estimating for small firms in each industry on the basis of the gross value-inventory ratio of reporting firms.

Commencing with 1954 questions on inventory were put back on the forms used in the annual survey of manufactures. As a result, all establishments with shipments of \$50,000 or more were required to give this information. As in the case of the calendar year-end series, estimates for establishments with shipments of under \$50,000 were made on the same basis. By comparing the two series for 1954 it was found that they differed slightly. This is mainly due to the difference in time of reporting this information. In the first series the figures refer to the end of December while in the second they refer to the company year which in a number of cases might be anywhere from the end of January to the end of June. The figures in the direct series are accordingly higher by 3,6 p.c. This is due to the desire of most companies to have as low an inventory as pos-

sible at the end of their financial year. When the financial year is other than the calendar year they could and usually do report a higher figure for December than they do for the end of their financial year which is reported in the second series.

It should be noted that the calendar year-end values as shown in the table below are not strictly comparable with those published in previous general reviews on manufacturing, since the series previously published has been reduced by the entire value of inventories held but not owned, i.e. held under progress payments arrangements. The deduction was made from the goods in process component. In previous reviews an item of total inventory holdings was shown separately, but no attempt was made to assign it to any specific component. While the assumption that all such inventory is part of goods in process is not strictly true, it is nevertheless a fairly good working approximation.

Company year-end inventories in 1955 totalled \$3,409,060,253, of which amount \$1,670,401,235 was raw materials and supplies, \$706,432,040 goods in process and \$1,032,226,978 finished goods. The foods and beverages group with \$538.4 million reported the highest inventory of any group. Iron and steel products with \$529.8 million came second, followed by paper products with \$285.1 million, transportation equipment \$251.4 million, wood products \$243.3 million, chemicals and allied products \$234.6 million, electrical apparatus and supplies \$233.0 million, etc.

^{1.} Revised

^{2.} Less than \$50,000.

^{3.} The opening inventory for 1955 differs from the closing inventory of 1954 because of the receipt of revised data, the inclusion of new firms and the removal of figures for firms that did not operate during 1955.

Subsection 3. Employment in Manufacturing Industries

Monthly Record of Employment. — Ordinarily, manufacturing employment in Canada reaches its highest point during the summer months. Some of the seasonal industries, such as canning, are most active then, textile industries are preparing winter goods, and industry generally feels the active demand of the agricultural purchasing power resulting from the prospect of the season's harvest.

After the setback of 1929, employment in 1930, 1931, 1932 and the first half of 1933 declined steadily, the monthly employment figures in each case being lower than the corresponding month of the previous year. The peak of employment in June, 1929, when 575,693 production workers were on the payrolls. was surpassed in September, 1937, with 582,305 production workers. After the outbreak of war the improvement in employment became increasingly rapid. A record high was reached in August, 1943, when 1,067,890 production workers were employed, an increase of 96.4 p.c. over the same month in 1939. The highest employment during 1944 occurred in June when 1.049,557 production workers were employed. From then on employment declined steadily to the end of 1945 when 819.619 production workers were reported. At the end of 1951 there were 953,952 production workers employed, compared with an employment of 961,820 production workers in December, 1944, and 1,021,630 in December, 1943.

During the first half of 1952 the number of production workers increased each month, but not to the extent of the employment in the same month of the previous year. From the middle of the year monthly employment figures exceeded those of the previous year. This trend continued to October 1953. The trend for the next two months was downward so that by the end of 1953 there were only 990,611 production workers as compared with 1,018,764 at the end of December 1952.

The minor recession experienced in 1954 is reflected in the monthly employment figures, the number employed each month being lower than the corresponding month of the previous year, although there was the usual upturn during the summer months. Employment at the end of December at 932,786 was at the lowest level since 1949 when 906,851 persons were employed. December 1952 with 1,018,764 production workers had the highest year-end figures during this period.

The downward trend of 1954 continued until the end of April 1955. From then on the monthly employment figures were consistantly higher than the corresponding months of 1954 so that by the end of December 1955 production workers totalled 993,215 as compared with 932.786 the year before.

Subsection 4. Hours Worked in Manufacturing Industries

Hours Worked by Production Workers. - From 1932, the first year for which figures on hours worked per week by production workers are available, to 1945, each firm was required to report the number of hours worked by all its production workers during the month in which the greatest number had been employed, the only exception being the years 1938 and 1939 when one week in a month of normal employment was reported. In 1938 the number of hours worked per week were compiled by sex, and a change was also made in the analysis of the weekly hours worked. Since 1940 the hours worked per week include overtime while prior to that overtime was excluded. These changes make it impossible to measure accurately the changes in the number of hours worked per week. In any case, the figures in Table 29 do not refer to any particular month, since the month of highest employment might be May for one firm and October for another; they represent the summation of the different months of highest employment as reported by all firms. For a given industry, however, the month of highest employment is more significant as in this case it coincides for a great number of firms engaged in the same industry.

For all production workers, the hours worked per week declined from 48.9 in 1932 to 47.2 in 1939, and reached 50.6 in 1941, some of the increase no doubt being due to the inclusion of overtime. Since then there was a counter movement in the hours worked, especially among females, due to the employment of many workers on a part-time basis. Whereas in 1939 there were only 2.8 p.c. of male and 5.3 p.c. of female production workers working under 30 hours per week, in 1944 these percentages rose to 5.3 and 12.5 respectively. Since the end of the war the normal working week has been dropping steadily. In 1945 average hours per week for male production workers totalled 47.6 and for females 42.7.

The method of collecting statistics on hours worked was changed in 1946. Instead of collecting this information for one week in the month of highest employment which varied from plant to plant, the last week of November was chosen for the base period. For 1948 and subsequent years the period was changed to the last week in October. The question on hours worked was taken out of the annual schedules used in connection with the census of manufactures and this information is now collected by the Employment Statistics Section. Establishments employing 15 hands or over only are covered. The statistics for 1946 to 1955 are, therefore, not exactly comparable with those for earlier years which include all establishments, both large and small.

On the above basis, the hours worked per week declined for all workers engaged in manufacturing. The hours of male production workers dropped from 44.9 in 1946 to 42.3 in 1954, female production workers from 40.0 to 38.5, male office employees from 42.0 to 39.0 and female office employees from 39.5 to 37.9.

Persons employed in 1950 and 1953 were classified on the basis of earnings per week instead of hours worked. For this reason the distribution of employees by hours worked per week is not available for these years. It is the intention in future to classify employees one year on the basis of hours worked, the second year on the basis of weekly earnings, while in the third year no break-down of either the hours worked or weekly earnings will be collected. Instead a more detailed break-down of salaried employees into (a) managerial and professional and (b) office workers will be requested.

Supervisory and office employees as a rule work shorter hours than production workers as the following figures for 1955

	Production Workers	Supervisory and Office Employees
Both sexes	42.0	39.1
Male	42.7	42.0
Female	39.4	39.5

TABLE 29. Production Workers in Manufacturing, Working Specified Numbers of Hours per Week in the Month of Highest Employment, 1938-451

Note. Hours worked per week in 1934-37 are given at p. 393 of the 1942 edition of the Canada Year Book; in 1940 and 1941 at p. 392 of the 1943-44 edition.

1. Prior to 1946 the figures refer to the week of highest employment and cover all establishments while for 1946 and 1947 they refer to the last week in November and for 1948 to 1955 the last week in October for establishments employing 15 hands and over only.

Subsection 5. Earnings in Manufacturing Industries

In 1955, the 38,182 establishments covered, employed 287,469 supervisory and office employees and 1,010,992 production workers, a total of 1,298,461 persons. Out of every 1,000 persons employed in manufacturing, 221 were classed as office employees and 779 as production workers; the former earned 28 p.c. and the latter 72 p.c. of the total amount paid out as remuneration for services.

A notable feature during the past few years was the reduction in the disparity between average annual earnings of office and production workers. Whereas in 1939 average annual earnings of production workers were only 56 p.c. of that paid to office workers, in 1943 the percentage rose to 76, they declined to 69 in 1947 and rose to 74 in 1955. This tendency towards equalization was due, in part, to the controls adopted

by the Government during the war years which tended to stabilize earnings of office workers more so than the earnings of production workers. The increase in average earnings of production workers was also influenced by the fact that large numbers were employed in the highly paid iron and steel industries and by the increase in the number of hours worked, some at overtime pay.

Ontario has a larger proportion of females among its office employees than the other provinces. The same situation prevails in Quebec with regard to production workers, due, no doubt, to the textile industries of the Province. The importance of the textile industries in providing employment to females is strikingly illustrated by the fact that of all female production workers engaged in the manufacturing industries of Canada in 1955, 42 p.c. were found in the textile and clothing groups,

Average earnings of office workers in 1955 amounted to \$3,990 which was \$1,154 or 41 p.c. higher than in 1949. Office

employees in Ontario with \$4,156 were the highest paid. Those in British Columbia were second with \$4,079, Quebec third with \$3,959 and Manitoba fourth with \$3,632. The fact that head offices of many large corporations are located in Montreal, Toronto, Winnipeg and Vancouver tends to raise the average salary of the provinces in which these cities are located.

Average earnings of production workers in 1955 amounted to \$2,963 which was \$896 or 43 p.c. higher than in 1949. The manufacturing industries of British Columbia paid the highest average wages of \$3,307. Ontario with \$3,166 was in second place, followed by Saskatchewan with \$3,017, Alberta \$2,977, Manitoba \$2,762, Newfoundland \$2,752, Quebec \$2,695, etc. The high figure shown for Yukon and Northwest Territories in regard to average earnings of production workers is due to the unusual conditions under which industry is carried on in these regions, and is not representative, Statistics of the distribution of employees by provinces and industrial groups as well as average annual earnings are given in Table 33.

-										

^{1.} The averages of the number of production workers and earnings for the years 1931 to 1955 are strictly comparable with those for the years up to 1925 but not with those for the intervening years. The figures for the latest years — as for the earliest — represent the earnings for complete manyears of work, with no allowance for periods of unemployment. The difference amounts only to about 3 or 4 p.c. in the total figures and affects chiefly the seasonal industries.

^{2.} The increase in the number of office employees in 1931 is due to the following changes in method: 1. Prior to 1931 working proprietors, such as bakers, sawmill operators, small clothing manufacturers, etc., were required to report themselves as production workers. In 1931 and subsequent years, however, all such proprietors reported themselves as office employees. 2. In 1931 travelling salesmen who were attached to the plant, and devoted all or the greater part of their time to selling the products of that plant, were included with office employees. Prior to this they were not reported at all.

Average Annual Earnings in the Forty Leading Industries—Variations in average earnings are related to the number of employees in industries or areas where pay levels are above or below the average because of differences in basic pay rates, in sex and occupational distributions, in amounts of bonus or commission payments, in levels of activity, etc. The earnings of salaried men are substantially higher, on the average, than those of other categories, mainly because their numbers include relatively highly-paid managerial and professional workers. Women's earnings are generally well below those of men in the same industry, chiefly as a result of pay differentials, occupational differences, the greater incidence of part-time work and absenteeism among women, and their higher proportions of younger and less experienced workers.

In 1955 there were three industries paying office workers \$5,000 or over, as compared with none in 1951. Indicative of the rapidly changing pattern of remuneration in manufacturing is the fact that in 1945, the last year of the war, no industry paid office workers annual salaries of over \$3,000. The highest average earnings in that year were \$2,935 reported by the brewing industry. Highest average earnings in 1955, amounting to \$5,636 were received by the office and supervisory employees of the pulp and paper industry which held the premier position for a number of years. Breweries with \$5,539 and non-ferrous

metal smelting and refining with \$5,167 were the two other industries with salaries of \$5,000 and over. There were six industries with average salaries of \$4,500 to \$5,000. These were: motor vehicles \$4,977, primary iron and steel \$4,936, acids, alkalies and salts \$4,745, bridge building and structural steel \$4,743, motor vehicle parts \$4,711 and petroleum products \$4,570. In nineteen other industries average salaries ranged between \$4,000 and \$4,500, in eight they were between \$3,500 and \$4,000, while in the remaining four they were below \$3,500. Sash, door and planing mills with \$3,140, bread and other bakery products \$2,888, butter and cheese \$2,690 and sawmills \$2,184 were the four industries in this category. Average salaries in the forty leading industries totalled \$4,084 as compared with \$3,789 for the smaller industries. The lower average is due in part to a higher proportion of female office employees in the smaller industries. In the forty leading industries 26 p.c. of the office employees were female while in the smaller industries 33 p.c. were in this category.

The increase in the average earnings of production workers since 1945 paralleled that of office and supervisory employees. Whereas in 1945 there were only four industries averaging over \$2,000, in 1955 the number jumped to thirty-six. In 1945 the highest annual earnings, amounting to \$2,365, were paid by the motor vehicle industry, while in 1955 the highest earnings which

totalled \$4,189 were paid by the petroleum products industry which has been in first place for a number of years. The highest earnings are usually paid by industries in which the proportion of skilled workers is high, and the proportion of female workers is low. Three industries in 1955 had average annual earnings of \$4,000 or more. These were: petroleum products \$4,189, primary iron and steel\$4,089 and pulp and paper \$4,004. Eight other industries had annual averages of \$3,500 to \$4,000. Non-ferrous metal smelting and refining \$3,933, acids, alkalies and salts \$3,856, motor vehicles \$3,764, breweries \$3,705, bridge building and structural steel \$3,665, aircraft \$3,661, printing and publishing \$3,665, and wire and wire goods \$3,539 were in this category. In fifteen other industries average an-

nual earnings ranged between \$3,000 and \$3,500, in ten others they were between \$2,400 and \$3,000, while in the remaining four they were below \$2,000. This last group includes industries made up of a large number of small establishments and in which the proportion of female workers is high. Men's factory clothing, women's factory clothing, leather footwear and fruit and vegetable preparations are the industries included in this group. Average annual earnings of production workers in the forty leading industries amounted to \$3,120 as compared with \$2,610 for the smaller industries. The lower average for the smaller industries is due mainly to a higher proportion of female workers. Employment by sex, and average annual earnings in the forty leading industries are given in Table 34.

Average Annual, Weekly and Hourly Earnings of Production Workers.—In comparing earnings by provinces or groups, consideration should be given to the type of industries in each case since the distribution of industries has a very definite regional significance. In some industries a labour force possessing deftness and speed or the ability to excercise muscular strength is necessary, in others the labour force must exercise craftsmanship or possess a high degree of technical knowledge. Workers in the latter industries naturally command relatively higher payments than those employed in industries whose employees are routine workers.

The ranking of provinces and industries as regards annual earnings is in many cases different to that of weekly or hourly earnings since the factors of number of weeks worked per year and number of hours worked per week enter into the picture. So that, while in general the same observations apply, a close study of the differences between the averages shown in Tables 33 and 34 will be of value.

The figures for the years 1934 to 1945 given in Table 35 are based on an analysis of a pay-list covering one week in the month of highest employment. For this reason the figures do not refer to any particular month, since the month of highest employment might be May for one firm and October for another; they represent the summation of the different months of highest employment as reported by all the firms. For a particular industry, however, the month of highest employment is more significant as in such a case it coincides for a great number of firms engaged in the same industry. The figures since 1946 are based on returns received from establishments employing 15 hands or over, and for 1946 and 1947 they refer to the last week in the month of November, whereas for 1948-1955 they refer to the last week in the month of October.

Average weekly earnings of male production workers for manufacturing as a whole amounted to \$66.86 in 1955, an increase of \$19.53 or 41 p.c. as compared with 1949. Average hourly earnings advanced from \$1.07 in 1949 to \$1.57 in 1955. an increase of 47 p.c., while annual earnings at \$3,267 were 43 p.c. higher. There are wide regional and industrial variations in hourly earnings. British Columbia is the highest paying province, hourly earnings for male production workers being \$1.81 in 1955 as compared with \$1.57 for Canada as a whole. Ontario with \$1.64 was second while Prince Edward Island with \$1.02 was the lowest. On an industrial basis, male workers in the products of petroleum and coal industries were the highest paid with an hourly average of \$1.97, while the leather and textile groups has the lowest average of \$1.20.

Female production workers received on an average \$37.52 per week in 1955, an increase of \$10.34 or 38 p.c. since 1949. Hourly earnings at 95 cents were 39 p.c. higher, while annual earnings at \$1,833 were also 39 p.c. higher. In the case of females, British Columbia with \$1.12 per hour was also the highest paying province, while Newfoundland and Prince Edward Island with 55 cents were the lowest. The transportation equipment group with \$1.28 per hour paid the highest wages to its female production workers, and the leather products group the lowest with 81 cents per hour. The leather products group had the lowest hourly earnings for both male and female production workers.

The following table gives the weekly and hourly earnings of male and female production workers for each province and major industrial group for the year 1955.

For the method used in calculating average annual earnings for male and female workers separately, see text preceding Table 38.

^{2.} Not available.
3. Prior to 1946 the figures refer to week of highest employment and cover all establishments while for 1946 and 1947 they refer to the last week in November and for 1949 to 1955 the last week in October for establishments employing 15 hands and over only.

^{1.} Dash indicates that the information is not available.
2. The average annual earnings are calculated on the basis of the total amount paid during the year as reported to census of industry, while the weekly earnings are based on an analysis of the pay-list for the last week in October and only cover establishments employing 15 hands or over. The drop in the average annual earnings is due in part to these factors as well as to the fact that in 1951 statistics for the processing of fish in Newfoundland were included with manufactures for the first time. As this is a seasonal industry annual earnings are, therefore, lower. In 1951 average annual earnings of production workers for both sexes for this industry averaged \$1,151 as compared with \$2,806 for the other industries of the

Average Annual, Weekly and Hourly Earnings of Supervisory and Office Employees.— Beginning with 1946 the survey on weekly earnings and hours worked by production workers was expanded to include office employees as well. The survey covers establishments employing 15 hands or over and refers to the last week in November for 1946 and 1947, and to the last week in October for 1948-55. Earnings and hours worked are reported for male and female workers separately in 13 groups of hours, ranging from 30 hours or less to 65 hours or more. The earnings reported for the week is the gross amount paid before deductions for income tax, unemployment insurance, etc. Weekly

and hourly earnings as well as the hours worked are thus obtained directly from the tabulated results of the establishments covered. The annual earnings, however, have to be calculated as they are not directly obtained from the survey. To calculate annual earnings the results on weekly earnings are correlated with the results obtained through the annual Census of Industry. The following case will illustrate the method used.

In 1949 the paper products group, according to the annual census of industry, reported 9,077 male and 3,573 female

office employees with total payments of \$46,537,336. From the October survey on weekly earnings this group showed \$77.41 per week for male and \$34.88 per week for female office employees. The proportion of female to male earnings is therefore $.451 \begin{bmatrix} $34.88 \\ $77.41 \end{bmatrix}$ Female employees are first reduced to a male basis and the calculation is then as follows:

Annual Earnings of Male Employees

one week in the year exclude such payments.

\$4.354x.451

$$\frac{\$46,537,336}{9,077+.451(3,573)} = \frac{\$46,537,336}{10,688} = \$4,354$$
Annual Earnings of Female Employees

In the foregoing calculation the assumption is made that annual earnings of male and female employees vary in the same proportion as their weekly earnings. In the above illustration it may also be noted that the calculated annual earnings for male employees amounting to \$4,354 are higher than the weekly earnings multiplied by 52 which total only \$4,025 (\$77.41x52). This difference is due to the fact that the earnings reported to the Census of Industry include payments to executives as well as bonuses to employees which are usually

paid at the end of the year, while the earnings reported for the

It is the intention in future to alternate the system of classifying employees. One year the basis will be the hours worked per week and the following year it will be on the basis of the earnings per week. Information will thus be made available on both the number of hours worked as well as the range of weekly earnings of employees engaged in manufacturing.

Annual earnings of male office employees in 1955 averaged \$4,636, weekly earnings \$93.50 and hourly earnings \$2.36. For female office employees annual earnings averaged \$2,332, weekly earnings \$47.02 and hourly earnings \$1.24. Average annual earnings of all office employees totalled \$3,990 in 1955, an increase of 76 p.c. since 1946. Weekly earnings at \$80.57 were 84 p.c. higher and hourly earnings at \$2.06 were 93 p.c. higher. Male employees in the products of petroleum and coal group received the highest salaries of \$121.46 per week. Paper products came second with \$111.47 and leather products last with \$78.49. In the case of female employees, salaries paid by the tobacco and tobacco products group at \$56.74 per week were the highest. Products of petroleum and coal with \$54.77 was second and leather products with \$39.81 last.

The following table gives the weekly and hourly earnings of male and female office workers for each province and major industrial group for the year 1955.

Average Weekly and Hourly Earnings of Male and Female Supervisory and Office Employees by Provinces and Industrial Groups, 1955

Office Workers and Other Salaried Employees.—A survey of weekly earnings of supervisory and office employees, classified into (a) managerial and professional employees and (b) office workers, was undertaken for the first time in 1951 and repeated again in 1954. It is the intention to repeat this survey every third year in the future. According to Table 41 below average weekly salaries of all office and supervisory employees in 1954 averaged \$77.81. Male employees received \$90.99 and female employees \$45.00. The increase per week since 1951 for all employees totalled \$11.83, for males \$13.44 and for females \$6.58.

The average weekly salaries of office workers rose in the three years from \$51.14 to \$59.29, an advance of 15.9 p.c. as compared with 17.9 p.c. for all salaried employees. The average for men classed in the office group increased by \$10.26 to \$70.94, and for women by \$6.39 to \$44.16, representing an advance of 16.9 p.c. in each case. The upward movement was more pronounced in the durable goods division than in non-durables. Higher earnings for office workers were reported in 1954 in all provinces and industry groups, except tobacco and tobacco products, where the men's average salary, at \$68.31 was \$1.87 below the 1951 figure. The drop was caused mainly

by the transfer of a group of employees to a separately organized sales office since 1951 when they were paid well above the general level.

The residual group of salaried employees, composed mainly of managerial, professional and related staffs and professional salesmen, comprises a varied group, the composition of which may differ from firm to firm. Its components are affected not only by varying requirements for administrative and professional personnel but also by the extent to which proprietors

and firms members (excluded from the survey) undertake such duties, and by the organization of separate sales offices. The managerial and professional employees reported in 1951 averaged \$98.38 for the week; the men earned \$99.73 and the women \$57.04. Three years later, the averages were \$109.67 for both sexes, \$111.14 for men and \$64.89 for women. All industry groups and provinces reported higher earnings in 1954, raising the average salaries of the men to more than \$100 a week in most of the major industries in Canada.

Distribution of Employees on the Basis of Weekly Earnings. Manufacturers were required to classify their male and female employees into 16 groups of earnings, from \$10 or less to \$100 or more, rising by \$5 intervals from \$10 to \$59.99, and by \$10 intervals from \$60 to \$99.99. The 1950 survey which covered the last pay period in October made available data on the distribution of employees by earnings groups for the first time since the Census of Manufactures survey in January 1944, The data in the two surveys are not strictly comparable, largely because the earlier surveys included establishments employing less than 15 persons and were conducted for a different period of the year. Also the 1944 survey reflected wartime conditions.

Variation in the provincial distribution of employees by amounts earned are obviously related to pay levels, occupational and sex differences, number of casual and part-time workers, and length of the working week in the more important industries in each area. Most of the employees in the lowearnings ranges are casually-employed workers, or those who do not work full time in the week. Part-time work is particularly common among women; the 1952 survey showed that 11.9 p.c. of the female production workers reported in manufacturing worked 30 hours or less, as compared with 4.6 p.c. for men. Short-time or casual work is characteristic of such industries as fish processing and fruit and vegetable canning, the duration of employment depending on the immediate availability of materials

The tremendous change in the level of incomes of factory workers since the war is strikingly illustrated in Table 42, Whereas in 1940 only 3 p.c. of male and none of the female production workers received \$50 or more per week, in 1953 these percentages jumped to 78 and 14 respectively. percentage of employees in the lower income groups declined accordingly. Whereas in 1940, 72 p.c. of male production workers received less than \$30 per week, in 1953 the percentage declined to 5. For female production workers the percentage in these groups declined from 99 to 38,

For office workers information on the distribution by income groups is only available for 1944, 1950 and 1953. Earnings by office workers, too, advanced to unprecedented heights. The percentage of male office workers receiving \$50 or more per week rose to 88 in 1953 from 39 in 1944, while for females the percentage in 1953 was 25 as compared with none in 1944. Tables 43 and 42 give the distribution by income groups of male and female production workers as well as office workers by provinces and major industrial groups for 1953.

Real Earnings of Employees in Recent Years.—When the index number representing the average yearly earnings of production workers is divided by the consumer price index, on the same base, a mesure of "real" income is obtained. Index numbers for 1931 to 1955 are given in Table 45. In 1933,

the height of the depression, real earnings were 63.9 on the 1949 base. From then on they rose steadily and stood at 101.5 in 1944, an increase of about 59 p.c. In 1946 real earnings dropped to 94.6 and from then on continued to rise each year. In 1955 the index stood at 123.1.

Percentages of Salaries and Wages to Net Value of Products.— Table 46 shows the relation between salaries and wages paid by manufacturers and the total net value of production. Figures of gross production are often used in such calculations, but the values out of which the wages of employees must come in the long run are the values added to the raw materials while they are in the factory. Such added values constitute the real production of the manufacturing plant and are alone available for payment of salaries and wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met. The percentage of salaries declined steadily with the increasing manufacturing production from 1924 to 1929, while from 1931 to

1935 and again in 1939 and 1954, due to decreased industrial activity, the percentage of salaries to value added was above normal. It should be borne in mind, however, that salaried employees increased 343 p.c. during the period 1917-55 while wage-earners increased 87 p.c. The percentage of wages has fluctuated much less than that of salaries. The number of wage-earning employees may be more rapidly adjusted to the activity of the industry and wage levels likewise may be more readily adjusted to the price levels of the products. Of the increase in the net value of production since 1939 amounting to \$7,222,398,595, \$3,405,598,381 or 47.2 p.c. was passed along in increased salaries and wages.

^{1.} Equivalent to "net value of products", see footnote 1, Table 1.

Subsection 6. Size of Manufacturing Establishments

The size of the manufacturing establishment is generally measured either by the value of product or by the number of employees, but each of these methods has its limitations. The latter takes no account of the differences in capital equipment at different times or in various industries and obviously the increased use of machinery, as in the flour-milling industry, may lead to an increase in production concurrently with a decrease in number of employees. The former measure has to be adjusted for changes in the price level and, as between industries, it makes those in which the cost of raw materials is relatively high appear to operate on a larger scale.

Size as Measured by Gross Value of Products. - While in 1922 the 420 establishments each producing over \$1,000,000 had an aggregate value of products of \$1,268,056,129 or 51 p.c. of the total production of all manufacturing industries, the 719 establishments producing over \$1,000,000 each in 1929 had an aggregate value of products of \$2,516,064,954, or 62 p.c. of the grand total for all manufacturing establishments - a very significant change in the short period of eight years. In 1931, however, the number of plants with a production of over \$1,000,000 dropped again to 482, their output being valued at \$1,451,658,954, or 53 p.c. of the total. With the increased production resulting from war needs, the number of plants with a production of \$1,000,000 or over jumped to 1,376 in 1944 and their output was about 75 p.c. of the total value of manufactures. With the end of the war and the consequent decline in production of the huge war plants the number of establishments with a production of \$1,000,000 or over, although increasing to 1,442 in 1946, nevertheless saw a decline in the proportion of their output to 67 p.c. of the total. With increased prices and an expansion in the physical volume of production during 1947 to 1955, establishments with a production of \$1,000,000 or over increased to 2,729 while their contribution to the total output rose to 80 p.c.

^{1.} Under this heading are included only those head offices that are not located at the plant.

size as Measured by Number of Employees.—In 1929, establishments employing 501 hands or over accounted for 27.3 p.c. of the number of employees engaged in manufacturing The tendency then in evidence of increasing concentration into larger units was checked by the depression, the percentage dropping to 20.5 in 1933, (central electric stations included), but rising again to 25.6 in 1939. The same holds true for establishments employing 101 hands or over. In 1929 they employed 61.9 p.c., in 1933, 55.7 p.c. and in 1939, 61.5 p.c.

The effect of the War on the concentration of industries into large units is illustrated by the increase in the number of establishments employing 500 hands or over. In 1939 such establishments numbered 172 and employed 25.6 p.c. of the total number of employees engaged in manufacturing. By 1944 the number had increased to 383 and the percentage of total employees to 47.0. In a further subdivision of this group in 1944 it was found that 226 establishments employed between 500 and 999 persons, 56 between 1,000 and 1,499, and 101 employed over 1,500. Altogether there were 12 plants employing over 7,000 persons, the largest having an employment of a little over 13,000 with the next three largest employing between

9,000 and 10,000. Three other plants employed between 8,000 and 9,000 persons, while the lowest five plants in this group employed between 7,000 and 8,000 workers.

With the resumption of peace-time production the larger establishments declined in size so that by 1955 only 61 establishments employed over 1,500 persons, as compared with 101 in 1944. The largest manufacturing plant in Canada in 1955 employed over 9,000. In the 8,000 to 9,000 group there were three establishments, in the 7,000 to 8,000 group two establishments and in the 6,000 to 7,000 group three establishments. The following is the size distribution of the highest group, 1,500 and over.

Employees	Establishments
1,500 to 2,999	41
3,000 to 3,999	4
4,000 to 4,999	4
5,000 to 5,999	3
6,000 and over	9
Total	61

Size of Establishment in Leading Industries.— Table 53 summarizes the degree of concentration in some of the leading industries of Canada. Concentration is extremely marked in the case of motor vehicles, non-ferrous metal smelting and refining, railway rolling-stock, cotton yarn and cloth, primary iron and steel, pulp and paper, and heavy electrical machinery; whereas

in the case of women's factory clothing, miscellaneous food preparations, furniture, butter and cheese, bread and other bakery products, fruit and vegetable preparations, sawmills and men's factory clothing, the degree of concentration is low. This concentration is analysed in detail for each of the twenty-five leading industries in the tables following.

TABLE 53. Percentage Importance of Establishments, each Employing 200 or more Persons in the Twenty-Five Leading Industries, 1955

No.	Industry	Number of such establishments	Percentage of total number in the industry	Percentage of total shipments in the industry

Subsection 7. Fuel and Power Consumption

Cost of Fuel and Electricity. - Fuel is used quite generally throughout the industrial field for the generation of power by means of steam and internal combustion engines. It is also used for the heating of plants, and for providing the heat necessary to some manufacturing processes. The most important industries where heat is applied to the materials to facilitate or accomplish the desired transformation are foundries and machine shops, brick, tile, lime, and cement-making, petroleum refining, the glass industry, distilleries, food preparation, rubber goods, etc. Fuel used for such heating purposes, as well as for power, is included in the figures of Table 55. In addition to the electricity used for ordinary power purposes, the figures include also the electricity used for heating boilers in the pulp and paper industry. Consumption of surplus energy in electric boilers increased rapidly during the years preceding the Second World War.

The figures of the table do not include coke charged to iron-blast furnaces or foundry cupolas. Neither do they include fuels that constitute the raw materials to be transformed, as coal in the coke and gas industries and crude petroleum in the refining industry.

The value of purchased fuel consumed increased 395 p.c. from 1939 to 1955. Part of the increase was due to an increase in the quantity used and part to the rise in the unit cost of fuels of all kinds. The cost of electricity purchased, on the other hand, has increased during the same period by 246 p.c. The groups of industries in which fuel was most extensively used in 1955 were: paper products, non-ferrous metals products, iron and steel products, foods and beverages, non-metallic mineral products, products of petroleum and coal, and chemicals and allied products.

Of the total cost of purchased fuel and electricity for Canada as a whole in 1955, 61.8 p.c. was for fuel and 38.2 for electricity. Percentage wise, New Brunswick with 77.0 p.c. of the Provincial total was the largest user of fuel, while Quebec with 51.5 p.c. was the smallest. Provinces lacking in water power resources naturally have to rely on fuel for power, and for this reason the percentage that fuel is to the total is much higher than in Provinces such as Quebec where there is an abundant supply of water for power purposes. In the Provinces of Prince Edward Island, Nova Scotia, New Brunswick, Saskatchewan, and Alberta, primary power produced from fuels is an important factor in power utilization.

Power Consumption. — Power equipment installed in manufacturing establishments is a very good barometer of the industrial development of Canada, inasmuch as production is increasingly dependent on power equipment. Increases and decreases in productive capacity, measured in horse-power, are not the result of temporary fluctuations in cost and values in the same manner as capital investments, values of products,

etc. Of course, power equipment installed is not a measure of the actual utilization of power for there is generally an excess over actual requirements, i.e., over power equipment in operation. Producers must have an installed operating margin in excess of normal requirements to provide for booming business conditions or breakdown of part of the plant. In times of depression this margin increases. During short periods of expanded production, the number of horse-power per wage-earner tends to decrease in view of the fact power equipment is not immediately increased, the expanded production being secured through overtime work or an increase in the number of shifts worked.

Of the total increase in power equipment employed in manufacturing industries between 1939 and 1953, 75 p.c. was in electric motors operated by power purchased from central electric stations. However, some sections of Canada are not well provided with water power and in such sections primary power derived from steam engines or turbines, and internal combustion engines - which include all gasoline engines, gas engines (natural, coal, and producer gas), and compressionignition engines-also has increased rapidly during the period covered. During the period 1939-1953 there was an increase of 31 p.c. in the capacity of hydraulic turbines and water wheels, 56 p.c. in the capacity of steam engines and steam turbines, 115 p.c. in the capacity of electric motors, while internal combustion engines increased more than fivefold. The collection of statistics on power equipment was discontinued in 1949, but was collected again for 1953.

Power consumed by the manufacturing industries, purchased power as well as power generated for own use, totalled 44.8 billion K.W.H. in 1955, an increase of 131 p.c. as compared with 1939. Of the total consumed, Quebec used 52.7 p.c., Ontario 26.8 p.c., British Columbia 11.5 p.c., New Brunswick 2.0 p.c., Newfoundland 1.9 p.c., and Manitoba 1.8 p.c.

The non-ferrous metal products group with 34.0 p.c. of the total was the largest user of electric power in 1955. Prior to this, the paper products group held the premier position in this respect. Although non-ferrous metal products had a small edge on the consumption of electric power, the paper products group still is the largest user of purchased fuel and electricity. The paper products group was the second largest user of power in 1955 with 33.9 p.c. of the total, followed by chemicals and allied products with 9.5 p.c., iron and steel products 6.3 p.c., non-metallic mineral products 4.2 p.c. and foods and beverages 2.7 p.c.

Table 55 gives details of purchased fuel and electricity as well as power consumption by industrial groups and provinces. Table 56 gives details of power equipment and Tables 57 and 58 give details of fuel consumption for selected years from 1826 to 1953.

Exclusive of the Butter and Cheese industry in the province of Quebec.
 Not collected.
 Includes manufactured and natural.
 Electricity purchased for metallurgical purposes in the non-ferrous Metal Smelting and Refining is included for the first time.

^{5.} Newfoundland included,
6. Included in the total,
7. For 1926, 1929 and 1933, fuel and electricity used by "Dyeing, cleaning and laundry work" and by "Central electric stations" have been deducted from the totals in order to make the series comparable with current data.

TABLE 58. Quantities of Fuel and Electricity Consumed in the Manufacturing Industries for Selected Years 1926-1948 and by Province and Industrial Group, 1953

^{5.} Electricity purchased for metallurgical purposes in the Non-ferrous Metal Smelting and Refining is included for the first time.
6. Newfoundland included.
7. Included in total.
8. For 1926, 1929 and 1933, fuel and electricity used by Dyeing, cleaning and laundry work" and by "Central electric stations" have been deducted from the totals already published in order to make the series comparable with current data.

PART II. PROVINCIAL AND LOCAL DISTRIBUTION OF MANUFACTURING PRODUCTION

SECTION 1. TYPE AND CONCENTRATION OF MANUFACTURING PRODUCTION

This part of the Report is introduced by a general analysis of the concentration of the manufacturing industries in the provinces. In the sections that follow, the principal features of the manufactures of each province are brought out and finally the distribution of manufacturing throughout the principal cities and towns of Canada is shown.

Ontario and Quebec are by far the most important manufacturing provinces of Canada. Their combined production in 1955 amounted to \$15,540,010,035 or 80 p.c. of the total gross value of manufactured products. The proximity of Ontario to the coal-fields of Pennsylvania, the water power and other varied resources of the provinces, and their nearness to the

larger markets of Canada and the United States have all contributed to this progress.

Table 1 shows the outstanding predominance of Ontario and Quebec in each industrial group. Quebec leads in the manufacture of tobacco and tobacco products, textiles (except clothing), clothing (textile and fur), and paper products. In each of the other groups Ontario has the greater production of the two provinces. In the production of wood products British Columbia with 43 p.c. of the total holds the dominant position, outranking both Ontario and Quebec which account respectively for 24 and 21 p.c. of the total. In each of the other groups Ontario and Quebec lead by a wide margin.

TABLE 1 Summary Statistics of Manufactures of Each Province, Classified by Industrial Group, 1955

Confidential. Included with miscellaneous industries.

Confidential, Includes all groups marked with 1.
Includes printing and publishing, sheet metal products, jewellery and silverware, petroleum products, and acids, alkalies and salts.
Publication of these figures are authorized by the firms concerned.

Included with all other groups.

The degree of concentration of manufacturing in large units is illustrated in Table 2. In Newfoundland 39.4 p.c. of all persons engaged in manufacturing were employed in establishments having 500 or more employees, as compared with 35.4 p.c. for Canada as a whole. Newfoundland thus assumed the premier position in 1954, displacing Ontario which formerly

ranked first. Ontario ranked second with 39.2 p.c., followed by Quebec with 36.8 p.c., New Brunswick 28.8 p.c., British Columbia 26.9 p.c., Nova Scotia 26.8 p.c., Manitoba 23.9 p.c. and Alberta 14.9 p.c. There were no plants in either Prince Edward Island or Saskatchewan with an employment of 500 or more persons.

TABLE 2. Concentration of Manufacturing Production in Each Province, 1955

Province	Number of establishments employing 500 or more persons	Percentage of total number of establishments in province	Provincial percentage of number of employees accounted for by these establishments

SECTION 2. THE MANUFACTURES OF THE ATLANTIC PROVINCES

The Atlantic Provinces are of economic importance in a number of fields, such as pulp and paper, fish processing, sawmills and primary iron and steel. In Newfoundland manufacturing production is dominated by the forest and fisheries resources. Pulp and paper was the most important industry in 1955 with shipments valued at \$62,615,842, followed by fish processing \$17,445,197. These two industries accounted for 69 per cent of the total production of the Province. In Prince Edward Island agriculture and fishing resources make butter and cheese, slaughtering and meat packing, fish processing, and prepared stock and poultry feeds the leading industries. Nova Scotia is renowned for its coal mines and its fisheries as well as extensive forests and agricultural lands and is favoured with easy access by sea to the high-grade iron-ore supply of Newfoundland. On these resources are based the leading manufactures of fish processing, primary iron and steel, shipbuilding and repairs, pulp and paper, sawmills, railway rolling stock, and butter and cheese. In addition, important petroleum refineries; cotton yarn and cloth, and coke and gas plants add to the diversification in the Province. The forest of New Brunswick give a leading place to its pulp and paper and sawmilling industries. Other important manufacturing and processing are based on fish and agricultural resources.

Nova Scotia and New Brunswick, despite the lack of large rivers. have valuable sources of hydraulic power, a considerable

portion, of which has been developed. Tentative estimates give Newfoundland a potential of almost 1,000,000 h.p. at ordinary minimum flow, while in Labrador, the Hamilton River is outstanding as a potential source of power. Turbine installation at the end of 1955 totalled 325,150 h.p. in Newfoundland, 1,882 in Prince Edward Island, 176,908 in Nova Scotia and 164,130 in New Brunswick. Compared with Quebec, Ontario and British Columbia, the installed power in the Atlantic Provinces, is very small, amounting to 668,070 h.p. This compares with a total of 1,191,845 in the Prairie Provinces and 17,735,221 in in the whole of Canada.

Considering the Atlantic Provinces as an economic unit, pulp and paper was the leading industry in 1955 with factory shipments valued at \$178,103,158. This was followed by fish processing with \$88,652,293, sawmills \$46,516,711, primary iron and steel \$43,561,192, shipbuilding \$26,806,967, and butter and cheese \$25,830,553. These six industries accounted for 54 per cent of the total value of factory shipments of the Atlantic Region. Other leading industries, in order of value of factory shipments, and with shipments valued at \$10,000,000 or more, were: sugar refining, petroleum products, sash, door and planing mills, bread and other bakery products, slaughtering and meat packing, miscellaneous food preparations, railway rolling stock, printing and publishing, prepared stock and poultry feeds and breweries.

According to Table 1, manufacturing establishments reporting in 1955 numbered 3,565 for the Atlantic Provinces as a whole. These plants furnished employment to 64,782 persons who received \$164,917,821 in salaries and wages. They also shipped goods with a selling value at the factory of \$765,166,607 and spent \$402,817,529 for materials, while the value added by manufacture totalled \$327,473,219.

For the Atlantic Provinces as a whole there was an increase of 2.2 p.c. in the number of persons employed and 6.2 p.c. in the value of factory shipments in 1955 as compared with

the previous years. Not all industries, however, shared in this advance. Of the leading industries railway rolling stock with a loss of 26.9 p.c. in the value of shipments reported the greatest decline. This was followed by shipbuilding with a drop of 13.6 p.c., slaughtering and meat packing 11.3 p.c., and prepared stock and poultry feeds 10.5 p.c. The majority of the leading industries, however, reported increased shipments. The greatest gain of 35.0 p.c. was reported by the primary iron and steel industry, followed by sawmills with 23.9 p.c. and fish processing 13.2 p.c., while for the other leading industries the increase ranged between 8.2 p.c. for printing and publishing and 0.4 p.c. for miscellaneous food preparations.

Principal Statistics of the Atlantic Provinces, 1955

Province	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments
	No.	No.	\$'000	\$'000	\$'000	\$'000
Newfoundland	785	10,361	28,604	49,915	60,587	115,579
Prince Edward Island	204	1,769	3,074	16,803	6,432	23,629
Nova Scotia	1,524	30, 218	76, 556	175, 194	139,646	331,130
New Brunswick	1,052	22, 434	56,683	160,905	120,808	294,829
Total	3,565	64, 782	164, 917	402, 817	327, 473	765, 167

In the Atlantic region the program of industrial development has been more selective than in some of the other provinces. Fish processing, new sawmills, increased pulp-making capacity and the manufacture of non-metallic building materials like cement and gypsum products have accounted for well over half of the industrial growth. There are however, a few outstanding exceptions. Two sizeable defence plants have been established in Nova Scotia, one to repair and overhaul naval aircraft and the other to build and repair radar and related electronic equipment. Considerable development has taken place in Newfoundland. Besides plants for the manufacture of cement and gypsum wallboard and plaster, factories for producing boots and shoes, birch veneer, leather goods, industrial machinery and a leather tannery were established, thus broadening the industrial base of the province. With these exceptions, most of the developments in the Atlantic Provinces have been either small and scattered or confined to the modernization and expansion of manufacturing facilities that were already established at the close of World War II.

In spite of the rapid development in the Atlantic Provinces since 1949 manufacturing production did not quite keep pace with the development in the more industrialized provinces of

Ontario, Quebec and British Columbia. This is indicated by a slight drop in the Atlantic Provinces' share of the Canadian total from 4.52 in 1949 to 3.92 in 1955. In number of persons employed there was an increase of 1.0 per cent for the Atlantic Provinces as compared with an increase of 10.6 per cent for Canada as a whole. For salaries and wages paid the increase was 37.8 per cent as compared with 59.7 per cent for Canada, and in selling value of factory shipments the increase was 32.5 per cent for the Atlantic Provinces and 56.2 per cent for Canada as a whole.

Up to 1952 the increase in employment in the Atlantic Provinces was about the same as for Canada as a whole. Since 1953, however, employment in the Atlantic Provinces declined by 6.0 p.c. while for Canada as a whole the decline was only 2.2 p.c. The increased employment since 1949 reported by Newfoundland, Prince Edward Island and Nova Scotia was offset by a drop of 4.3 p.c. in New Brunswick, resulting in a net increase of only 1.0 p.c. for the Atlantic Provinces as compared with an increase of 10.6 p.c. for Canada. Selling value of factory shipments were 32.5 p.c. higher in the Atlantic Provinces while for Canada as a whole they were 56.2 p.c. higher.

Variation in Employment and Factory Shipments, 1955 Compared with 1949

Province	Employees	Salaries and wages	Selling value of factory shipments
	p.c.	p.c.	p.c.
Newfoundland 1	+ 10.0	+ 56.8	+ 45.9
Prince Edward Island	+ 1.3	+ 44.1	+ 30, 4
Nova Scotia	+ 3.1	+ 40.0	+ 33,7
New Brunswick	- 4.3	+ 28.2	+ 27.4
Atlantic Provinces	+ 1.0	+ 39.8	+ 32, 5

TABLE 8 Principal Statistics of the Leading Industries of New Brunswick, 1955

SECTION 3. THE MANUFACTURES OF OUEBEC

Quebec with about 30 per cent of Canada's total selling value of factory shipments ranks as the second largest industrial province in Canada. Manufacturing establishments reporting in 1955 numbered 12,194. These plants furnished employment to 429,575 persons who received \$1,271,077,953 in salaries and wages. They also shipped goods with a selling value at the factory of \$5,922,367,074 and spent \$3,152,541,331 for materials, leaving the calculated value added by manufacture at \$2,622,333,056.

The manufacturing industries of Quebec, in common with other provinces, made a rapid recovery from the minor recession which occurred during 1954. All groups, with the exception of transportation equipment, reported increased value of shipments. For the province as a whole the increase was 9.8 p.c. as compared with an increase of 11.2 p.c. for Canada. As regards employment, all groups, with the exception of transportation equipment and leather products, reported increases, the over-all for the province being 1.3 p.c. and for Canada 2.4 p.c.

Indexes of physical volume measure changes in production more accurately than any other indicators. Since such indexes are not available for provinces, changes in employment have to be considered as reflecting more or less the growth or decline of the various sectors of the manufacturing field. In comparing the changes in employment between the record high of 1953 with that for 1955 it is found that in spite of an increase of 9.9 p.c. in the value of shipments for the province as a whole, employment declined by 2.7 p.c. during the same period. The greatest decline in employment since 1953 was reported by the transportation equipment group with a drop of 28.7 p.c. This was followed by leather products with a drop of 9.3 p.c., clothing 5.2 p.c., textiles 3.7 p.c., wood products 3.0 p.c., iron and steel products 2.8 p.c., tobacco 1.6 p.c. and knitting mills 0.8 p.c. Nine groups on the other hand had more employees in 1955 than in 1953. Of these, non-metallic mineral products with an increase of 14.0 p.c. reported the greatest expansion in production. This was followed by paper products with an increase of 10.4 p.c., printing, publishing and allied trades 7.7 p.c., rubber goods 7.4. p.c., products of petroleum and coal 3.1 p.c., chemicals and allied products 2.8 p.c., foods and beverages 2.7 p.c., non-ferrous metal products 2.7 p.c., and miscellaneous industries 1.9 p.c. The electrical apparatus and supplies group reported no change.

Quebec has developed its \$5.9 billion manufacturing output with such leading industries as pulp and paper, non-ferrous metal-smelting and refining, petroleum products, slaughtering

and meat packing, cotton yarn and cloth, men's and women's clothing, tobacco, cigars and cigarettes, synthetic textiles and silk, railway-rolling stock, leather footwear and miscellaneous electrical apparatus. In common with the rest of Canada, Quebec experienced a great industrial expansion following the second World War. Nor was this expansion confined to the existing industrial areas, but spread to many towns and villages in the accessible areas of the province.

Quebec's leading industry is pulp and paper with an output of approximately \$561 million in 1955. Quebec is a principal world centre for the production of newsprint with 55 major pulp and paper plants concentrated in the Three Rivers and Shawinigan Falls districts as well as along the Saguenay, Ottawa, and St. Lawrence rivers. The production of non-ferrous metals has expanded considerably during the past decade. The output of aluminum has made impressive strides during the past years and reached a record total of 612,543 tons in 1955. After the end of the war, with the disappearance of the demands for defense, surplus productive capacity appeared. New civilian used were found to take up the slack, so that by 1948 the industry was producing 75 p.c. of its peak wartime output. To this has been added the defense demands created by the Korean war and in 1952 the peak level of production attained in 1943 has again been reached. Quebec, with its new furniture factories, its new titanium smelter and its expanded aluminummaking facilities, is challenging Ontario's long established lead in a number of the wood and non-ferrous metal products industries.

There are several important factors which contributed to the great industrial development of the Province. To begin with, the geographic situation of the Province is extremely favourable, with an excellent large harbour 800 miles inland where seagoing vessels of heavy tonnage can dock. There is also an extensive highway system linking the small rural areas to the big industrial centres. Other significant factors include abundant forest resources, water power, minerals, agricultural lands and, of even more importance, an industrious and stable population.

Quebec ranks highest in available water-power resources, having more than 40 p.c. of the total recorded for all Canada. Its power development has been remarkable and its installation of 8,031,422 h.p. at the end of 1955 represents about 45 p.c. of the total for Canada. The St. Lawrence River Beauharnois development of 1,408,000 h.p. and the Saguenay River Shipshaw development of 1,200,000 h.p. were the two largest in the country up to 1955.

^{1.} Includes: Biscuits; breweries; brass and copper products; brooms, brushes and mops; cement, hydraulic; railway rolling stock and sugar

The completion of the Sir Adam Beck-Niagara Generating Station No. 2 on the Niagara River which raised the combined capacity of Stations Nos. 1 and 2 to 1,820,000 h.p. makes it the largest single installation in Canada.

Two of the most important industrial developments in Quebec today are the Ungava iron ore project and the new titanium industry. With the exploitation of the Ungava iron deposits on which it is believed, the future of the great steel industries of this Continent rests, Quebec's industrial base is being expanded to the point where the future industrial development of this Province is well assured.

Quebec's industries are not as diversified as those of Ontario, although a number have an output approximately half or more of the total Canadian production. The manufacture of pulp and paper occupies the premier position. Fifty years ago this industry had hardly come into existence in the Province and in the mid-1920's the annual gross value of production had not yet reached \$100,000,000. By the end of 1955 it accounted for about 9 p.c. of the gross value of Quebec's manufactures and for about 42 p.c. of the Canadian total for this industry. Other large Canadian industries in which Quebec predominates are tobacco, cigars and cigarettes 94.0 p.c. of the Canadian total; women's factory clothing 69.5 p.c.; cotton yarn and cloth

67.6 p.c. men's factory clothing 56.2 p.c., synthetic textiles and silk 53.0 p.c., miscellaneous electrical apparatus and supplies 48.6 p.c., miscellaneous chemical products 44.2 p.c., non-ferrous metal smelting and refining 43.6 p.c., pulp and paper 42.3 p.c., railway rolling stock 42.0 p.c., acids, alkalies and salts 39.3 p.c., brass and copper products 37.6 p.c., and petroleum products 35.0 p.c. Two medium-sized industries with Canada shipments of over \$100,000.000 also predominated in Quebec. These were: leather footwear with 58.2 p.c. and medicinal and pharmaceutical preparations 48.7 p.c.

Quebec also predominates in a large number of the smaller industries. The candle industry contributed 95.6 p.c. of the Canadian total; men's clothing contractors 94.4 p.c.; cotton thread 82.5 p.c.; women's clothing contractors 81.9 p.c.; children's clothing 79.5 p.c.; embroidery, hemstitching, etc. 77.7 p.c.; dyeing and finishing of textiles 77.6 p.c.; oilcloth, linoleum, etc. 73.5 p.c.; fur dressing and dyeing 71.9 p.c.; process cheese 71.2 p.c.; lasts, trees and shoe findings 70.4 p.c.; oiled and waterproofed clothing 70.4 p.c.; miscellaneous clothing 69.3 p.c.; narrow fabrics 69.1 p.c.; bot and shoe findings, leather 67.2 p.c.; artificial flowers and feathers 64.8 p.c.; corsets 58.4 p.c.; fur goods 58.0 p.c.; miscellaneous textiles 55.1 p.c.; asbestos products 51.4 p.c.; buttons 48.7 p.c. woollen cloth 47.4 p.c.; musical instruments 38.4 p.c.; etc.

TABLE 9. Principal Statistics of the Forty Leading Industries of Quebec, 1955

No.	Industries	Estab- lish- ments	Em- ployees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments

^{1.} Sugar refining is also a leading industry. Statistics, however, are confidential.

SECTION 4. THE MANUFACTURES OF ONTARIO

The manufacturing industries of Ontario in 1955 reported \$9,617,642,961 as the selling value of factory shipments, an increase of 12.7 p.c. over the previous year. This is the highest on record and exceeded the previous high attained in 1953 by 8.3 p.c. Accompanying the increase in shipments was an increase of 2.5 p.c. in the number of employees which totalled 613,872 in 1955. Although the selling value of factory shipments in 1955 exceeded the previous high figure reported in 1953, the number of persons employed did not, however, reach the record number of 634,554 reported in 1953. This result conforms to the trend in recent years for employment to increase at a lower rate than volume of production. With the increase in automation and technological improvements this trend should continue even at a more accelerated pace. Indicative of this trend is the increase since 1949 for Canada as a whole of 24.5 p.c. in the volume of production as compared with an increase of only 10.9 p.c. in the number of persons employed. Since indexes of volume of production are not available by provinces no comparison can be made for Ontario. There is no doubt, however, that the volume of production in Ontario in 1955 was the highest on record even though the number of employees is still 20.682 below the record number employed in 1953.

As Ontario is a major producer of durable goods, such as transportation equipment, primary iron and steel, telecommunications equipment and heavy electrical machinery, it therefore experiences wider fluctuations in manufacturing production than provinces producing nondurable or consumer goods. As a result, the small downturn of 1954 was more keenly felt by Ontario manufacturers. Factory shipments in that year were 3.9 p.c. lower as compared with a drop of 1.3 p.c. for Canada as a whole, while in employment the drop in Ontario was 5.6 p.c. and for Canada it was 4.5 p.c. Conversely, with the improvement in 1955 Ontario reported an increase of 12.7 p.c. in factory shipments and 2.5 p.c. in employment. This compares with increases of 11.2 p.c. and 2.4 p.c. for Canada as a whole.

Establishments reporting in 1955 numbered 13,276. They furnished employment to 613,872 persons who were paid \$2,088,905,627 in salaries and wages, and spent \$5,014,225,423 for materials used. The value added by manufacture which is the calculated value of production less the cost of materials used, including the cost of fuel and electricity, amounted to \$4,426,654,771, while the selling value of factory shipments totalled \$9,617,642,961.

Ontario, which is now recognized as one of the world's major industrial areas, accounts for approximately half of Canada's manufacturing production. Here, the proximity of raw materials, cheap hydro-electric power, and a strategic location in relation to export markets, not only on this continent but overseas, have been the decisive factors in the development of Ontario to its present industrial position. Most of the manufactures of the province and most of its population are located in Southern Ontario. This area has the inestimable advantage of bordering on the St. Lawrence-Great Lakes water-way system which gives access westward to the heart of the continent and eastward to the shipping routes of the world, and which is also the source of most of Ontario's hydro-electricity. Many new industrial areas are being created as new industries and branch plants of established industries are increasingly being located in the smaller towns.

Despite the great industrial progress made by other provinces. Ontario continued to maintain its predominance and in 1955 produced about 49 per cent of the nation's manufactured goods. A vast increase of steel ingot capacity is being made possible by developments at Steep Rock Iron Mines. At Sarnia, huge investments have gone into the construction of new plant for a whole group of new products based on Alberta oil flowing through the Edmonton-Superior pipe line. Other significant developments are taking place in synthetic rubber, synthetic textiles, and industrial and consumer chemicals. Ontario has continued to gain in such traditional lines as motor vehicles, industrial and farm machinery, and the manufacture of household equipment. The same may be said of other "hard" goods like business and office machinery and electrical apparatus and supplies. Numerous plants making aircraft components and building materials have favoured the Toronto area, while chemical and synthetic textile plants have been rising in the vicinity of Sarnia and along the lower reaches of the St. Lawrence River between Cornwall and Kingston.

Ontario has the greatest diversification of manufacturing production of any province. Certain industries, such as the

manufacture of motor vehicles, motor vehicle parts, heavy electrical machinery, agricultural implements, machine tools, starch and glucose, bicycles and the processing of raw tobacco are carried on practically in this province alone. Of the forty leading industries in Canada in 1955, a substantial number of them were dominated by Ontario's share of the total production. These industries, with the percentage which the production of each bears to that of the 1955 Canada totals are as follows: motor vehicles 98.9, motor vehicle parts 96.1, heavy electrical machinery 91.0. rubber goods 81.3, telecommunications equipment 79.2 primary iron and steel 78.4, iron castings 70.7. fruit and vegetable preparations 65.6, aircraft and parts 64.9. miscellaneous paper products 63.0, sheet metal products 59.0 printing and bookbinding 58.5, brass and copper products 58.3 industrial machinery 57.1, acids, alkalies and salts 53.8, boxes and bags, paper 52.1, furniture 50.5, miscellaneous chemical products 50.0, miscellaneous electrical apparatus 49.2 and printing and publishing 48.4.

There are also a number of medium-sized industries with a total Canadian production of over \$100,000,000 in which Ontario dominated. Agricultural implements with 92.4 p.c., soaps and washing compounds 88.4, refrigerators, vacuum cleaners, etc., 80.1, household and office machinery 73.9, hardware, tools and cutlery 71.6, heating and cooking apparatus 69.6 and confectionery 56.5 p.c. were in this category.

In addition Ontario dominated many of the smaller industries in 1955 as follows: machine tools 100.0, tobacco processing and packing 95.6. bicycles and parts 94 5, automobile accessories, fabric, 90.0, prepared breakfast foods 89.8, miscellaneous non-ferrous metal products 88.6, wine 87.3, leather tanneries 86.5, typewriter supplies 86.1. carpets, mats and rugs 84.1, artificial abrasives 82.1, wool yarn 79.3, cordage, rope and twine 77.0. sporting goods 76.7, scientific and professional equipment 75.7, white metal alloys 74.9, batteries 74.3, toys and games 72.2, jewellery and silverware 71.8, animal oils and fats 68.7, feed mills 67.2, boilers, tanks and plant work 66.4, aluminum products 66.0, knitted goods 51.6 and hosiery 45.0.

SECTION 5. THE MANUFACTURES OF THE PRAIRIE PROVINCES

The leading industries of the Prairie Provinces are those based on agricultural resources - grain-growing, cattle-raising and dairying areas. Next in importance, generally, are industries providing for the more necessary needs of the resident population, such as the baking of bread, printing and publishing, etc. The extensive railway services require large shops for the maintenance of rolling-stock, especially in the Winnipeg area. The widespread use of motor vehicles and power machinery on farms has given rise to petroleum refineries in each province. The greatly increased production of crude petroleum in Alberta seems likely to lead to further development of the refining industry. This industry which was in second place in 1955 has made tremendous strides in the Prairie Provinces since 1949. At that time it ranked third in importance, being outranked by slaughtering and meat packing which was then in first place and by flour mills which ranked second. Of greater significance is the fact that it has increased its proportion of the total manufacturing production of the Prairie Provinces from 8.5 p.c. in 1949 to 15.8 p.c. in 1955. Manitoba, as the early commercial centre of the prairies, has had a greater industrial development than either of the other provinces. Its natural resources of accessible water powers, forests and, more recently, minerals, have given rise to quite a diversification of industrial production. In Saskatchewan, while the main economic role continues to be played by agriculture, both oil and mineral wealth are being developed.

Considering the Prairie Provinces as an economic unit, slaughtering and meat packing had the largest value of factory shipments in 1955, amounting to \$255,845,172, followed closely by petroleum products with \$240,593,535, flour mills \$98,389,707, butter and cheese \$93,680,847 and railway rolling stock \$41,700,389. These five industries accounted for about 48 p.c. of the total value of factory shipments of the Prairie Provinces.

Other leading industries, in order of value of factory shipments and with shipments of \$10,000,000 or more were: non-ferrous metal smelting and refining; bread and other bakery products; printing and publishing; breweries; sash, door and planing mills; sawmills; miscellaneous food preparations; men's factory clothing; bridge and structural steel; furniture; sheet metal products; concrete products; prepared stock and poultry feeds; printing and bookbinding; pulp and paper; sugar refining; paper boxes and bags; carbonated beverages; women's factory clothing; hydraulic cement; primary plastics; and primary iron and steel.

In water-power resources, the Prairie Provinces are not so well endowed as the more highly industrialized provinces of Quebec, Ontario and British Columbia. At the end of 1955 power installation in the three Provinces totalled only 1,191,845 h.p. or about 7 p.c. of the Canadian total. Manitoba had 796,900 h.p., Saskatchewan 109,835 h.p. and Alberta 285,110 h.p. With the present developments of natural gas and oil, the Prairie Provinces, will in large measure be able to overcome a lack of water-power resources which is so vital to industrial development. Manitoba has more water-power resources and has developed them to a greater extent than either of the other Prairie Provinces. Practically all the developed sites are located on the Winnipeg River. These supply not only Winnipeg and its suburban areas but, also more than 400 municipalities and a large part of rural areas of southern Manitoba where farm electrification is a primary objective. In Saskatchewan, water-power development is confined to the northern mining districts. The southern portions of Saskatchewan and Alberta are lacking in water-power resources but have fuel reserves. In Alberta, present developments are located in the Bow River basin and serve Calgary and numerous other municipalities between the International Boundary and the area north of Edmonton.

In the Prairie Provinces, the nature of developments vary from one province to another. Alberta has moved to the forefront, especially since 1950. There the emphasis has been more on the manufacture of machinery and equipment for the burgeoning oil and gas industries. Chemicals, and especially petrochemicals, have made striking gains; second in terms of new growth, they now embrace various rayon intermediates and polythene plastics, as well as fertilizers and the manufacture of other new inorganic products like caustic soda and chlorine. Sizeable gains have been made by the expansion of food-processing plants and the construction of still more factories for making building materials.

Developments in Saskatchewan, by contrast, have continued along more or less traditional lines. The largest gains, for instance, have been recorded in food processing. The manufacture of building materials, including non-metallic mineral products and lumber, has also increased. However, the largest single gain in employment has been in the refining of prairie oil for local use.

Although Manitoba experienced a great development in manufacturing production since 1939, it did not, percentagewise keep pace with the other two Prairie Provinces. Since 1946, however, the development was on a wide front. The increase in the number of persons employed totalled 2,951. The largest

increase of 1.256 was reported by the iron and steel group. The clothing industries with 1,231 reported the second largest increase, while the printing, publishing and allied industries reported an increase of 655. This was followed by products of petroleum and coal with 374, non-metallic mineral products 344, electrical apparatus and supplies 306, miscellaneous industries 293, paper products 285, wood products 225, etc. Only three groups reported declines in employment; foods and beverages 1.839, knitting mills 152 and transportation equipment 135. The food and beverages group which in 1946 accounted for 30 p.c. of the employment in manufacturing, accounted for only 23 p.c. of the total in 1955: The food and beverages group with 9,693 employees was still in first place in 1955 as an employer of labour. This was followed by transportation equipment with 6.184, clothing 5,800, iron and steel products 4,937, printing, publishing and allied industries 3,725 and wood products 3,132. These six industries accounted for 81 p.c. of the manufacturing employment in Manitoba.

According to Table 1 below, manufacturing establishments reporting in 1955 numbered 4,635 for the Prairie Provinces as a whole. These plants furnished employment to 87,654 persons who received \$263,092,899 in salaries and wages. They also shipped goods with a selling value at the factory of \$1,524,661,353 and spent \$869,800,319 for materials, while the value added by manufacture totalled \$624,379,431.

Principal Statistics of the Prairie Provinces, 1955

Province	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments
	No.	No.	\$'000	\$'000	\$'000	\$'000
Manitoba	1, 549	41, 318	121,719	329, 699	247, 472	588, 351
Saskatchewan	960	11,490	34, 826	174,079	113,599	295, 162
Alberta	2, 126	34, 846	106, 549	366,023	263, 309	641,148
Total	4, 635	87, 654	263, 094	869, 801	624, 380	1, 524, 661

In spite of the rapid development in the Prairie Provinces since 1939, manufacturing production did not keep pace with the developments in the more industrialized provinces of Ontario, Quebec and British Columbia. This is indicated by the slight drop in the Prairie Provinces'share of the Canadian total from 8.13 p.c. in 1939 to 7.91 p.c. in 1953. In 1954 conditions were reversed. The Prairie Provinces reported an increase of 1.4 p.c. in the value of factory shipments as compared with a decline of 1.3 p.c. for Canada as a whole. As a result of this the Prairie Provinces' share of the Canadian total was again 8.13 p.c., the same as in 1939. In 1955, however, the situation deteriorated again with the percentage of the total dropping to 7.81. Although the increase of 11.5 p.c. in the value of factory

shipments for Alberta was slightly higher than the 11.2 p.c. increase for Canada as a whole, the failure of Manitoba and Saskatchewan to keep pace with the general expansion resulted in an increase of factory shipments of only 6.8 p.c. for the Prairie Provinces as compared with 11.2 p.c. for Canada.

According to the table below, Manitoba and Saskatchewan did not keep pace with manufacturing developments in Canada as a whole. Alberta on the other hand fared much better. Compared with 1939 employment increased by 174 p.c. and the value of factory shipments by 633 p.c. This compares with increases for Canada as a whole of 97 p.c. and 462 p.c. respectively.

Variation in Employment and Factory Shipments, 1955 Compared with 1939

Province	Employees	Earnings	Selling value of factory shipments
	p.c.	p.c.	p.c.
Manitoba	+ 73	+ 328	+ 338
Saskatchewan	+ 77	+374	+ 387
Alberta	+174	+ 611	+ 633
Prairie Provinces	+ 103	+ 418	+ 440
Canada	+ 97	+ 461	+ 462

^{1.} Includes: Cement, hydraulic; fertilizers; non-ferrous metal smelting and refining; primary plastics; sugar refining.

SECTION 6. THE MANUFACTURES OF BRITISH COLUMBIA

British Columbia, with factory shipments valued at \$1,679,344,816, ranked third among the provinces in manufacturing production. In spite of the rapid industrialization of other provinces, British Columbia succeeded in increasing its share of the total Canadian output. This is reflected in the increase in the total from 7.1 p.c. in 1939 to 8.6 p.c. in 1955.

Forest resources, fisheries, minerals and electric power have given a broad base and wide diversification to its industrial development. While Ontario and Quebec have an outstanding predominance in each of the major industrial groups of the Standard Industrial Classification, in the production of wood products, however, British Columbia with 43 p.c. of the Canadian total holds the dominant position, outranking both Ontario and Quebec which account respectively for 24 and 21 p.c. of the total.

Emphasizing the importance of the forest in the industrial life of the Province, the sawmilling industry ranked first with a gross value of factory shipments of \$414,944,542, and pulp and paper second with \$169,370,459. Third in importance was the petroleum products industry with factory shipments valued at \$101,985,120. This industry received a great impetus in the completion of the Trans-Mountain oil pipeline. In 1953 with

shipments valued at \$40,562,462 it ranked seventh, and contributed about 3 p.c. to the total value of factory shipments of the Province. In 1954 it assumed third place with the proportion of the total increasing to 5.5 p.c., with a further increase to 6.1 p.c. in 1955. In sixth place was fish processing, based principally on the estuarial salmon fisheries. This industry was in third place in 1953. British Columbia accounted for approximately 41 p.c. of the output of the fish processing industry in 1955 and plays a large part in making Canada the largest fish exporting nation in the world. Other important industries are: sash, door and planing mills, veneers and plywoods, slaughtering and meat packing, miscellaneous food preparations, fertilizers, shipbuilding, butter and cheese, fruit and vegetable preparations, etc. The non-ferrous metal smelting and refining industry also ranks high among the leading industries. Information, however, cannot be published as there are less than three smelters located in the province.

A feature of recent progress has been that new developments are taking place in areas far removed from accepted industrial centres. Growing lines of communication and transportation are fanning out from and leading into formerly locked interior communities to tap a vast new potential and offer new sources of provincial economic unity and strength. Factories

and plants in remote sections are drawing greater value in employment and dollars from natural resources. The growth of the province industrially may be indicated by the increase in employment which is two and one-half times the pre-war figure. In dollar terms, gross value of manufacturing is also up more than sixfold since 1939. The consumption of 5.2 billion kwh of electric power by manufacturers during 1955 marks a steady upward climb of 150 per cent in the past decade.

British Columbia ranks second among the provinces in available water-power resources and its hydraulic development which at the end of 1955 totalled 2,439,508 h.p., out of a Canadian total of 17,735,221 h.p., is exceeded only by Quebec and Ontario. Present developments are practically all located in the southern part of the province in the Fraser and Columbia River Basins. The Aluminum Co. of Canada is making excellent progress in its great Kemano-Kitimat scheme, involving diversion of the head-waters of the Fraser River through the coastal range by a ten-mile tunnel to an underground powerhouse. The highlight of hydro-electric construction in 1955 was the completion of the first stage of this project. The first four turbines, each of 150,000 h.p. were brought into operation. A fifth unit of 150,000 h.p. is scheduled for completion in 1957, and the ultimate capacity is expected to be about 2,000,000 h.p. This power will be used in the production of aluminum which is a new product for British Columbia. Present capacity of the smelter is 90,000 tons of aluminum per annum, with a potential of 550,000 tons, a production which will further strengthen Canada's position as an important source of this vital metal.

Manufacturing establishments reporting in 1955 numbered 4,486. These plants furnished employment to 102,408 persons who received \$353,810,727 in salaries and wages. They also shipped goods with a selling value at the factory of \$1,679,344,816 and spent \$895,973,668 for materials, while the value added by manufacture totalled \$750,877,508.

The manufacturing industries of British Columbia expanded during 1954, at a time when the rest of Canada experienced a minor recession. For Canada as a whole there was a drop of 4.5 p.c. in the number of employees and 1.3 p.c. in the value of shipments. British Columbia was the only province in 1954 reporting increased employment, the increase being 2.2 p.c. Although British Columbia was not the only province to report increased shipments, the increase of 7.9 p.c. was, however, the highest of any province. In common with other provinces, manufacturing in British Columbia continued to expand during 1955. Of all provinces British Columbia reported the greatest increase in employment and value of factory shipments. Employees were 6.8 p.c. higher as compared with an increase of only 2.4 p.c. for Canada, while the value of factory shipments were 13.9 p.c. higher for British Columbia and 11.2 p.c. for Canada as a whole.

^{1.} Other leading industries for which statistics cannot be shown since there are less than three establishments in each industry are: Non-ferrous metal smelting and refining; Sugar refining and Distilled liquors.

SECTION 7. MANUFACTURING INDUSTRIES IN URBAN CENTRES

The prosperity of most of the cities and towns of Canada, especially in the east, is intimately connected with their manufacturing industries, which provide employment for a large proportion of their gainfully occupied population. In the west the cities are more largely distributing centres, though manufactures are rapidly increasing there also.

Table 15, indicating the extent to which the manufacturing industries of Canada are concentrated in urban centres, shows by provinces the proportion contributed by cities and towns having factory shipments of over \$1,000,000 each. In the more highly industrialized provinces of Ontario and Quebec such cities and towns in 1955 accounted for 79 p.c. and 93 p.c. respectively of the totals for those provinces, while for the Atlantic Provinces and British Columbia, where sawmilling, fish-packing, and dairying are leading industries, the propor-

tions are 70 p.c. and 54 p.c. respectively. In the Prairie Provinces manufacturing is confined to a few urban centres.

During the past few years there has been a noticeable trend for manufacturing plants to locate in rural areas adjacent to incorporated cities and towns. This trend is revealed by a study of the percentages in the table below during the past few years. In 1955 for Canada as a whole 80.5 p.c. of the shipments were made by cities and towns with factory shipments of \$1,000,000 and over, as compared with 86.9 p.c. in 1953. Toronto is a good case in point. In 1953 Toronto accounted for 72.0 p.c. of the total shipments of York County and the rural areas for 12.2 p.c. while in 1955 Toronto's share dropped to 63.0 p.c. with the rural areas increasing to 21.2 p.c. The same trend is apparent in other manufacturing centres, This accounts for the changes that have taken place during the past few years in some of the provinces and for Canada as a whole.

TABLE 15. Cities and Towns Each with Selling Value of Factory Shipments of Over \$1,000,000, Number of Establishments and Total Shipments in such Urban Centres as a Percentage of the Grand Total, by Provinces, 1955

Note. Statistics published in this table are in some cases higher than the figures published in Table 18, since in the table below are included towns with shipments of over \$1,000,000 for which statistics must be withheld. It is not possible to publish this information in Table 18 without disclosing the operations of individual establishments.

Province	Number of urban centres with selling value of factory shipments of over \$1,000,000	Number of establishments reporting in urban centres with selling value of factory shipments of over \$1,000,000	Selling value of factory shipments of urban centres having \$1,000,000 or over	Selling value of factory shipments of each province	Selling value of factory shipments of urban centres as a percentage of shipments in each province

Net value is derived from gross value by deducting cost of materials, fuel and electricity. For cost of fuel and electricity in 1955 see Table 18.
 Since 1952 the basis of collection was "Selling Value of Factory Shipments" instead of "Gross Value of Products".

APPENDIX II

Alphabetical List of the Products Reported as having been Manufactured in Canada in 1955

The appended list of the products of Canadian manufacturing industries presents the value and in most cases the quantity of the individual products in a much more detailed form. Prior to 1927, in presenting statistics of manufacturing production, the whole production of an establishment was taken as a unit. This not only prevented the presentation of production figures for specific products in detail, but also involved numerous inaccuracies in the production statistics of classes of commodities, owing to the fact that commodities which may be the major line of production in one establishment may also be products of secondary importance in another establishment where the major line of production puts the establishment into a different class. The statistics which follow, however, have been compiled by taking from the individual returns of each of the 38,182 manufacturing establishments covered, the value and, when given, the quantity of each commodity specified as produced by the establishment. In this way, detailed production figures are obtained for specific commodities and, furthermore, the total production of each commodity is brought together, no matter how varied may be the operations in different establishments producing it. Nevertheless it should be pointed out to those making use of these figures that there is one element of incompleteness about them. In the returns of many manufacturers, products of minor importance are grouped under the name "all other products". As will be seen from the group at the end of the list, the value of products not specified, while they may appear unimportant to the individual manufacturer, are, in the aggregate, a large amount, especially in the industries of two of the larger groups. It is obvious that one manufacturer may consider a product of insufficient importance to report separately for his establishment, while that same product may be reported separately by other establishments. In other words, included in the value of other products not specified at the end of the list, there are doubtless values which, had the products been specified by manufacturer, would have been included in the values of commodities appearing on the list. However, the products not specified total only about 2.0 per cent in value of the whole manufacturing production, although in the iron and steel group this proportion is 5.3 per cent and in transportation equipment 7.4 per cent. With the exception of these groups, therefore, the incompleteness of the figures on this account is insignificant.

There is no duplication in the listing of products, nor do any of the items, include products listed in more detail under another name. It is possible, however, that essentially the same commodity produced in different establishments may have been called by different names; in such a case, which is probably a very rare one, the items would appear separately in the following list.

It should be noted that a shipment's concept instead of the value of production concept was adopted in 1952. The new concept was applied to a large number of industries where it was known that inventory changes from year to year was only of a minor nature. The new concept was extended to other industries in 195; and it is hoped to convert all industries to the shipment's concept by 1956. The alphabetical list of products for 1955, therefore, refers to commodities shipped and not to the value of commodities produced.

Alphabetical List of Commodities, 1955

Note:-In 1952 and subsequent years the basis of collection, is "Value of Factory Shipments" instead of "Gross Value of Products". However, the commodities marked* are still on a production basis.

Items	Unit of measure	Quantity	Value of factory shipments

GENERAL REVIEW OF THE MANUFACTURING INDUSTRIES OF CANADA 1956

DOMINION BUREAU OF STATISTICS

Industry and Merchandising Division

DOMINION BUREAU OF STATISTICS

Industry and Merchandising Division

GENERAL REVIEW

OF THE

MANUFACTURING INDUSTRIES OF CANADA

1956

Published by Authority of
The Honourable Gordon Churchill, Minister of Trade and Commerce

NOTICE

The annual reports prepared by the Industry and Merchandising Division of the Bureau of Statistics are divided into 3 volumes, as follows: Volume I — The Primary Industries, including mining, forestry and fisheries; Volume II — Manufacturing; Volume III — Merchandising and Services. The volumes are made up of parts, and the parts in turn are subdivided according to the industries or provinces which they comprise.

Volume II consists of the following parts, the first two of which deal with manufacturing as a whole and the balance with the major manufacturing groups.

I - General Review of the Manufacturing Industries

II - The Manufacturing Industries of Canada, (7 sections, as follows:)

Section A. Summary for Canada

Section B. Atlantic Provinces

Section C. Quebec

Section D. Ontario

Section E. Prairie Provinces

Section F. British Columbia

Section G. The Manufacturing Industries of Canada, Regional Distribution

III - Foods and Beverages

IV - Tobacco and Tobacco Products

V - Rubber Products

VI - Leather Products

VII - Textile Mills

VIII - Knitting Mills

IX - Clothing

X - Wood and Paper Products

XI - Printing Trades

XII - Iron and Steel Products

XIII - Transportation Equipment

XIV - Non-ferrous Metal Products

XV - Electrical Apparatus and Supplies

XVI - Non-metallic Mineral Products

XVII - Products of Petroleum and Coal

XVIII - Chemicals and Allied Products

XIX - Miscellaneous Manufactures

The present report is the only one in Part I. Price

Prices of most reports released after January 1, 1959 have been increased. Information on the new prices of particular issues is available on request from the Information Services Division of the Dominion Bureau of Statistics.

PART I. GENERAL ANALYSES OF MANUFACTURING SECTION 1. GROWTH OF MANUFACTURING

The improvement in manufacturing production begun in the summer of 1955 continued at an accelerated rate in 1956. The selling value of factory shipments at \$21,636,748,986 was the highest on record and exceeded by 10.9 p.c. the high mark attained the previous year. In employment, however, the record was not so impressive. Although there was an increase of 4.2 p.c. in the number employed in 1956 as compared with 1955, the number was only 25,569 higher than the record number employed in 1953. Salaries and wages paid at \$4,570,692,190 and value added by manufacture at \$9,605,424,579 were the highest on record, exceeding the previous high of 1955 by substantial margins.

The physical volume of production in 1956 was 5.4 p.c. higher than in the previous year, while the increase in the value of factory shipments was 10.9 p.c. The greater increase in the value of factory shipments is accounted for by an increase in the wholesale prices of partly and fully manufactured goods. The output of durable goods rose by 7.4 p.c., while non-durables were 4.4 p.c. higher. The index for manufacturing as a whole in 1956 stood at 285.9. For non-durable goods it was 245.6 and for durable goods 348.9. These levels were in all cases the highest on record. Since the end of the war both the durable and non-durable sectors experienced an uninterrupted expansion in volume of production, the only exception being 1954 when the output of both durable and non-durable goods was lower than the previous year. Since 1946 durable goods rose by 70.1 p.c., non-durable goods by 36.3 p.c. and manufacturing as a whole by 50.6 p.c.

In the non-durable goods sector all groups, with the exception of textiles, reported increased activity in 1956 as compared with 1955. The greatest increase in volume of production was reported by the products of petroleum and coal group with a percentage increase of 14.8. The leather products group which has experienced a long-term downward trend reported the second highest increase in volume with 8.2, followed by printing, publishing and allied industries with 7.9, rubber and rubber products 7.5, tobacco and tobacco products 7.3, beverages 5.1, clothing including knitting mills 4.7, paper products 4.5, chemicals and allied products 3.1, and foods 1.1. Textiles with a decline of 1.6 p.c. was the only group in the non-durable sector to report a decrease. In spite of the substantial increase in volume for manufacturing as a whole during 1954 and 1955, both textiles and clothing were still below the levels they attained in 1953.

In the durable goods sector all groups reported higher levels of production. The highest percentage increase of 14.1 was reported by the iron and steel products group. This was followed by non-metallic mineral products with 11.5, transportation equipment 6.0, non-ferrous metal products 5.5, electrical apparatus and supplies 2.8 and wood products 0.5. The transportation equipment group which was the only group in the durable goods sector to report a minor decline of 1.2 p.c. in 1955 reported an increase of 6.0 p.c. in 1956. Aircraft, automobiles, railway rolling stock and shipbuilding, all operated at higher levels. In spite of the improvement in 1956 the transportation equipment group was still about 15 p.c. short of the high level attained in 1953. The modest increase of 0.5 p.c. shown by the wood products group was the result of two counter movements. The increased volume needed to satisfy the requirements of the domestic boom in construction was just about counterbalanced by the decline in export sales. Exports of planks and boards which were valued at \$326,445,303 in 1956 declined by 14.5 p.c. as compared with the previous year. Red cedar shingles and veneer and plywood were also lower with declines of 20.7 and 7.3 p.c. respectively.

The improvement in manufacturing operations which occurred during 1956 was the result of three main factors. First was the accelerated spending on capital goods, such as construction and machinery and equipment of all kinds which rose from \$6,350,000,000 in 1955 to \$8,024,000,000 in 1956, an increase of 26 p.c. This stimulated the durable goods industries to a marked degree, and is reflected in the increased output of pig iron which rose from 3,215,367 tons in 1955 to 3,568,203 tons in 1956, steel ingots and castings from 4,534,672 tons

to 5,301,202 tons, aluminum from 612,543 tons to 620,321 tons, nickel from 174,928 tons to 178,515 tons, cement from 4,404,480 tons to 5,021,683 tons, and motor vehicles from 452,114 units to 471,350 units. The second factor was the improvement in the export demand for many Canadian manufactured commodities. Newsprint, whiskey, aluminum and its products, copper and its products, aircraft, lead and its products, non-farm machinery and synthetic plastics were all substantially higher in 1956 as compared with the previous year. Exports of wood pulp, nickel, automobiles and parts, artificial crude abrasives, and zinc and its products were moderately higher, while exports of planks and boards, red cedar shingles, veneer and plywood, wheat flour, farm machinery and fertilizers were considerably lower. The third factor was the impact on the consumer goods industries of the increase of about 425,000 in population as well as by the rise in labour income.

Ontario which is now recognized as one of the world's major industrial areas, accounts for approximately half of Canada's manufacturing production. Despite the great industrial progress made by other provinces, Ontario continues to maintain its predominance, and in 1956 accounted for 49.2 p.c. of the total value of factory shipments. Quebec with 30.6 p.c. of the total shipments ranks as the second largest industrial province, while British Columbia with 8.6 p.c. of the total ranks third.

The increased activity reported by the manufacturing industries during 1956 was not uniformly distributed as between provinces. From the point of view of numbers employed, British Columbia with an increase of 6.0 p.c. over 1955, once again made the greatest gain in manufacturing production. This was on top of an increase of 6.8 p.c. in 1954 and 2.2 p.c. in 1954. As a result of this uninterrupted expansion during the past few years, British Columbia is gradually increasing its share of the Canadian total. Alberta in 1956 reported the second highest expansion with an increase of 5.6 p.c. in employment, followed by Ontario with 4.5 p.c., Quebec 3.9 p.c., Nova Scotia 2.4 p.c., Newfoundland 1.4 p.c., New Brunswick 0.6 p.c., Saskatchewan 0.4 p.c., and Prince Edward Island 0.3 p.c.

The industrial expansion of Canada since Confederation has been phenomenal. In the past generation alone, Canada has changed from a country producing and exporting mainly primary products to a country that is increasingly producing and exporting manufactured products, until to-day manufactures account for about 30 p.c. of the value of all goods and services produced, and also rank as the leading employer of labour in Canada.

Canada is no longer on the fringes of industrialization but ranks among the world's most important manufacturing countries. Basic historical developments, such as the opening of the West and the magnitude of requirements of all kinds for World Wars I and II, have been followed by recent discoveries of far-reaching significance. Such events as the discovery of a major oil pool on the prairies in 1947, the discovery of largescale deposits of iron and the successful search for uranium have given new dimensions to Canadian thinking and business planning. These are the factors that explain the records of capital expenditures year by year since the end of the War. Yet it is not the mere rate of expansion that is significant. There have been other periods when Canada's population has grown more rapidly and in many respects the rate of industrial expansion in the late 1920's was relatively as great as in the post-war years, the real significance of the latter period is that never before has there been an advance on such a broad

The second point to be observed is the changing emphasis of Canadian manufacturing activity. By 1949 the period of postwar conversion was passed and Canada had entered a new phase of economic expansion which derived its dynamic from the discovery of new resources and the application of new processes. This meant that even the sharp recession in the United States in the year 1949 failed to have significant effects in Canada. The influence of Korea and the consequent rearmament program gave an added impetus to the expansion of Canadian industry and to the development of Canadian basic

resources. Capital expenditures that contributed most to the defence of Canada were given priority. Additional capacity was created to meet requirements of the specialized defence program—aircraft, electronic equipment, ships and guns—many items of which had never before been produced in Canada. Measures such as steel control, credit regulations and deferred depreciation had the desired effect. A shift gradually took place toward the further expansion of basic industrial capacity and away from investment in consumer goods and services.

The stability of current levels of manufacturing is indicated by the fact that such activity is the result of business assessments of resources and market potentialities. Millions of dollars are being invested in oil because the prairies can produce oil as economically as other great fields on the North American Continent. Petro-chemical plants are being erected because the raw materials are readily at hand. Kitimat is based on the coincidence of abundant and cheap hydro-power and access to ocean transportation, both of which are essential to the low-cost production of aluminum. The exploitation of the Ungava iron deposits rests on the belief that the steel industry of the North American Continent will need the high-grade ores involved in order to meet continuing peace-time demands. No country is in a more favourable position than Canada to supply uranium for the production of atomic energy.

Of strategic importance, and probably of even greater long-term significance to the Canadian economy, has been the growing world-wide shortage of raw materials; a shortage born of rising levels of employment and income, and accentuated by the course of international events, especially since 1950. These demands have shown few signs of abating and they have led to substantial increases in Canadian primary manufacturing capacity, particularly in so far as the light metals, nickel, chemical fertilizers and the cheaper grades of paper are concerned.

In recent years the demands stemming from population growth and a rising standard of living have been noticeable at all levels. In food processing, a steady up-grading in the quality of foods sold on the domestic market has been even more important than population growth. The two together have almost doubled the dollar sales of processed foods in this country since 1945. And at the intermediate level other important changes have taken place. Many of Canada's new chemical plants, for example, have been built with the domestic consumer market in mind. Frequently using petroleum or natural gas as a source of raw material, they have gone a long way towards making Canada independent of imports in such categories as vanillin, nylon and rayon intermediates, and plastics for packaging and similar uses.

The tremendous development which has taken place in Canada during the past ten years is strikingly illustrated by the increase of 50.6 p.c. in the physical volume of manufactured products between 1946 and 1956 as compared with an increase of only 31 p.c. in the population. Part of this increase, resulted from an increased demand abroad for Canadian manufactured goods, part to the demands imposed on Canadian industry as a result of the expansion in the economy during the past decade, and part to the increase in the standard of living of the Canadian people. The increase of 70.1 p.c. in the output of durable goods consisting mainly of building materials. transportation equipment as well as machinery and equipment of all kinds reveals the extent of the contribution made by Canadian industry to the phenomenal expansion in the productive capacity of the country. Non-durable goods during the same period increased by 36.3 p.c. Although this increase is quite large it is, nevertheless, overshadowed by the much larger increase of 70.1 p.c. in the durable goods industries of the manufacturing sector.

With only one exception, all groups in both the durable and non-durable sectors recorded marked advances in volume output since 1946, the exception being leather products with a decline of 11.9 p.c. In the durable goods sector the most striking advance was made by the non-metallic mineral products group with an increase of 137.5 p.c. This was followed by electrical apparatus and supplies with 122.5 p.c., non-ferrous metal products 78.5 p.c., transportation equipment 67.9 p.c., iron and steel products 47.3 p.c. and wood products 46.6 p.c.

In the non-durable goods sector the greatest advance was achieved by the products of petroleum and coal group with 164.3 p.c. This was the highest increase of any group of either sector. Rubber and rubber products with an increase of 101.6 p.c., came second, followed by printing, publishing and allied industries with 64.7 p.c., beverages 60.6 p.c., tobacco products 59.2 p.c., paper products 48.1 p.c., chemicals and allied products 26.5 p.c., foods 15.9 p.c., textiles 12.8 p.c., and clothing 2.0 p.c. The output of the leather products group declined by 11.9 p.c.

Manufacturing establishments reporting in 1956 numbered 37,428. Of these 783 were located in Newfoundland, 192 in Prince Edward Island, 1,402 in Nova Scotia, 1,004 in New Brunswick, 12,112 in Quebec, 13,215 in Ontario, 1,534 in Manitoba, 798 in Saskatchewan, 1,971 in Alberta, 4,393 in British Columbia and 24 in the Yukon and Northwest Territories. These plants furnished employment to 1,353,020 persons who received \$4,570,692,190 in salaries and wages. They also shipped goods with a selling value at the factory of \$21,636,748,986 and spent \$11,721,536,889 for materials, while the value added by manufacture totalled \$9,605,424,579.

The value added is obtained by subtracting the cost of materials, including fuel and electricity, from the gross value of products. The difference represents the value added to the materials by labour. It is this difference which the employer of labour uses to pay for the labour itself, the overhead expenses, interest and profits.

To calculate the value of production, it is necessary to adjust the value of shipments for the difference in the opening and closing inventories of finished goods and goods in process. As the census of industry schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added is obtained by subtracting from the shipments the cost of materials, including fuel and electricity. The value thus obtained is somewhat different to the actual value. Beginning with 1954 it is again possible to obtain value of production figures, by adding to the value of shipments the changes in the inventory of finished products and goods in process. The figures for value added in 1954 and and subsequent years are, therefore, comparable with 1951 and prior years.

A number of industries still report value of production. To calculate value added by manufacture for these industries, the value of materials used, including the cost of fuel and electricity, is subtracted from the value of production reported, no account is taken of inventory change. For this reason the figures on value added by manufacture for manufacturing as whole or for major groups published in this report differ slightly from the calculated figures derived by using the formula for converting shipments to production values which is "Shipment plus closing minus opening inventories of finished goods am goods in process equals value of production". To illustration this point 1955 figures for Canada will be used. These figure are as follows:

	\$'000,000
Value of factory shipments	19,513.
Inventory of finished goods and goods in process: Closing	1,738.
Opening	1,619.
Cost of materials used	
Cost of fuel and electricity	457.

Calculated value of production

(19,513.9 plus 1,738.6 minus 1,619.7=19,632.8)

Value added by manufacture

(19,632.8 minus 10,338.2 minus 457.8 = 8,836.8)

This is slightly different to the 8,753.5 figure given Table 1. The difference is due to the fact that the figures finventory change used in the formula are for manufacturing as whole and include the figures for those industries still on production basis and for which inventory changes have no been taken into account in calculating their value added manufacture.

Variation in Volume of Production

	Volume	index (1935-39	= 100)	Percentage variation			
Group	1956	1955	Percentage variation	1951 compared with 1946	1956 compared with 1951	1956 compared with 1946

Tables 1 to 3 give a picture of the growth of manufacturing, in general, as shown by comparable principal statistics, i.e., establishments, capital, employees, salaries and wages

paid, cost of materials and values of products. A number of interesting comparisons are made in Table 4 and figures of consumption are given in Table 6.

TABLE 1. Summary Statistics of Manufactures, 1917-56

Note: Statistics of manufacturing from 1870 have been published, but between that year and 1917 they are not on a comparable basis to the series given below. They will be found in Table 1 in the 1941 edition of this report. Statistics of the non-ferrous metal smelting industries were included in manufactures for the first time in 1925.

In manufactures for the first win	е и 1945.						
Year	Estab- lish ments	Capital	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture ¹	Gross value of products ²
	No	\$	No.	\$	\$	\$	\$
1917	21,845	2, 333, 991, 229	606, 523	497, 801, 844	1, 539, 678, 811	1, 281, 131, 980	2, 820, 810, 791

					1		

¹ Years 1924-1951, inclusive, the "'Value added by manufacture" is computed by subtracting the cost of fuel, electricity and materials from the gross value of products. Years 1952 and 1953 the deduction is made from "'Value of factory shipments" and in 1954 and subsequent years from the calculated value of production. Figures prior to 1924 are not comparable since statistics for cost of electricity are not available. (See text p. 8. last four paragraphs).

l in 1952 and subsequent years the basis of collection is "Value of factory shipments" instead of "Gross value of products."

A change in the method of computing the number of wage-earners in the years, 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931, however, the method in force prior to 1925 was re-adopted.

Newfoundland is included for 1949 and subsequent years, however, figures for the fish processing industry, 1949 and 1950, are not available for this province and therefore not included.

TABLE 2. Summary Statistics of Manufactures, by Provinces, Significant Years, 1917-56

Yukon and N.W.T.: 1939 1944 1949 1952	5 12 18 23	538, 847 Not collected	55 67 148 164	97, 766 118, 972 359, 068 530, 126	138, 500 189, 718 643, 807 1, 075, 561	92,054 280,803 604,896 1,022,974	242, 968 489, 256 1, 377, 453 2, 288, 039
1953 1954 1955 1956	30 31 26 24	6 6 6 6 6 6 6 8	177 191 170 175	569, 995 630, 316 604, 507 681, 433	1, 349, 970 1, 492, 898 2, 843, 895 3, 867, 415	1, 012, 008 1, 855, 633 1, 732, 511 1, 076, 223	2, 516, 683 3, 536, 300 4, 751, 000 5, 130, 497

In 1952 and subsequent years the basis of collection is "Selling value of factory shipments" instead of "Gross value of products".
 Includes for the first time the fish processing industry.
 A change in method of computing the number of wage-earners in the years 1925 to 1930 inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931 the method in force prior to 1925 was re-adopted.
 Includes Yukon and Northwest Territories.

TABLE 3. Summary Statistics of Manufactures, by Industrial Groups, 1945-56

	5 - 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1 -

¹ In 1952 the basis of collection was changed from "value of products made" to "selling value of factory shipments".
² Increase is due to the inclusion for the first time of establishments that publish periodicals without doing any printing.
² There were three major changes in concept affecting the data for the Primary Iron and Steel Industry in 1954. The first one involved a change in the method of counting establishments; the second concerned a change in valuing shipments of where rods transferred to makers' own processing in the method of counting establishments; the second concerned a change in valuing shipments of where rods transferred to makers' own processing in the method of calculating "value added by manufacture". Figures for 1954 and subsequent years are therefore not comparable with previous years. See footnotes to Table 2 of the 1954 report on the Primary Iron and Steel Industry.

4 Apparent advance in the selling value of factory shipments is due in part to an actual gain in physical output, but the major factor contributing to this increase was a change in accounting procedure by some firms of the petroleum products industry in calculating value of factory shipments. This increased the value by approximately \$139,000,000 over what the value would have been by the former method.

Significant Changes in Manufacturing Production. - The figures in Table 4 trace the tendencies in Canadian manufacturing industries as clearly as possible from 1917 to 1956. In analysing statistics of production and materials used, price changes should be borne in mind, particularly the inflation of values in the years immediately following World War I, the drop in prices of commodities during the depressions following 1921 and 1930, and the increases again in the recent war and postwar period. The figure that shows most clearly the trend of development is concerned with the use of power. The total horse-power employed increased from 1,658,475 in 1917 to 10,397,703 in 1953, an advance of about 527 p.c. in 37 years. In the same period, horse-power per production employee showed an uninterrupted trend from 3.06 to 10.82 in 1933 and 9.46 in 1939. With the large increase in the number of production employees on war production, and the more efficient utilization of the equipment available, the horse-power per production employee dropped to 6.28 in 1944; the increasing installation of power machinery and the decline in employment after the war resulted in a rise to 8.52 in 1948 and 9.87 in 1953. The significant feature is the increase in both the absolute figures of power employed and the averages per production employee during the depression years as compared with 1929, although the large numbers of persons again finding employment since 1933 reduced the averages for the years 1934 to 1937 and again for 1940 to 1945. Other interesting comparisons are the trend of value added by manufacture, per employee, and of average earnings since 1929. Between 1949 and 1956 the value of purchased fuel and electricity increased by 71.3 per cent; for full details of fuel and electricity used by the manufacturing industries see Tables 57 and 58.

Ower employed Averages, per establishment Averages, per production worker	hp.	5,045,287 203	6,468,439 227	2 2	10,397,70

¹ A change in the method of computing the number of production workers in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. There was, therefore, a proportionate reduction in the averages for 1925-30 per employee as compared with what these averages would have been under the other method. In 1931, however, the method in force prior to 1925 was re-adopted. The figures for 1931 and for later years are therefore comparable with those for 1924 and earlier years.

² Collected only every five years. These figures are for 1953 which is the latest year available.

³ See footnote 1, Table 1.

⁴ See footnote 2, Table 1.

Recent Changes in Manufacturing Production. - Table 5 shows the changes in the nature of manufacturing production since the end of World War II with regard to numbers employed. the salaries and wages paid, and the gross value of products. Owing to price declines during depressions and rises during periods of prosperity, the values of both wages and products are naturally affected more than the number of employees. Furthermore, during periods of curtailed production there is a tendency for production workers to be put on part time, while the number of office employees responds less quickly to reduction in output than that of production workers. Therefore, there are several reasons why the variation in number of employees should be less than that of money values. The figures of Table 5 are to be compared with those of Tables 8, 9 and 10 which show changes in volume of production. The number of employees in 1944 increased by 86 p.c. over 1939. Salaries and wages paid were 175 p.c. higher and the gross value of production 161 p.c. higher. Another significant change is the increase in the proportion of women engaged in manufacturing. Whereas in 1939, there were 281 females to every 1,000 males employed. in 1944 this figure jumped to 403.

Significant changes in the nature of manufacturing production took place after the cessation of hostilities in 1945. Industries engaged in war production operated at a substantially lower level, while industries producing consumer goods stepped up their production. From the point of view of employment the chemical and allied products group with a drop of 33 p.c. experienced the greatest decline in production between 1945 and 1949. Transportation equipment which includes aircraft and shipbuilding was second with a drop of 32 p.c., followed by tobacco and tobacco products with 12 p.c., rubber goods 12 p.c. and iron and steel products 3 p.c. The non-metallic mineral products group reported the greatest gain in employment with an increase of 39 p.c., followed by printing, publishing and allied trades 31 p.c., wood products 29 p.c., electrical apparatus and supplies 27 p.c., products of petroleum and coal 26 p.c., paper products 21 p.c., textiles (except clothing) 19 p.c., clothing (textile and fur) 18 p.c., foods and beverages 8 p.c., leather products 2 p.c. and non ferrous metal products 1 p.c.

For manufacturing as a whole there was an increase of 4 p.c. in the number of employees with an increase of 39 p.c. in the amount of salaries and wages paid. Although there was an increase of 50 p.c. in the gross value of production, the increase in the physical volume was only 3.4 p.c. This is due to the rise in the wholesale prices of fully and partly manufactured products

Between 1949 and 1954, for manufacturing as a whole, there was an increase of 40.6 p.c. in the gross value of production, 8.1 p.c. in employment, and 75.5 p.c. in salaries and wages paid. In terms of employment, the electrical apparatus and supplies group with an increase of 34.3 p.c. experienced the greatest expansion since 1949. Transportation equipment came second with 27.4 p.c., followed by non-metallic mineral products with 25.2, chemicals and allied products 24.9, products of petroleum and coal 20.7, miscellaneous industries 17.7, paper products 14.3, non-ferrous metal products 13.0, and printing, publishing and allied industries 11.0. The smallest gain was reported by the rubber products group with 0.8 p.c. Four groups reported declines in employment. Textiles led the list with a drop of 17.0 p.c., followed by leather products with 11.9, tobacco and tobacco products 11.4 and clothing 5.5.

Significant changes have also occurred regionally between 1949 and 1954. In terms of employment, there was an increase of 8.1 p.c. for Canada as a whole. With the exception of two provinces. New Brunswick and Manitoba, all other provinces reported increased employment in manufacturing. Alberta led in this respect with an increase of 24.0 p.c., followed by British Columbia with 15.6 p.c., Newfoundland 13.2 p.c. and Quebec 8.7 p.c. These four provinces were above the Canadian average of 8.1 p.c. Four other provinces also reported increases in employment, but below the Canadian average. Of these Ontario reported an increase of 7.5 p.c., Saskatchewan 6.3 p.c., Prince Edward Island 1.5 p.c. and Nova Scotia 1.0 p.c. Of the two provinces reporting declines New Brunswick suffered a drop of 5.7 p.c. and Manitoba a drop of 1.7 p.c. The following table gives the changes which have taken place in manufacturing during the past ten years, on an industrial as well as a geographical basis.

TABLE 5. Percentage Variation in Employment, Salaries and Wages, and Gross Value of Products in Each Province and Major Industrial Group, Compared for Significant Years, 1945-54

¹ Exclusive of fish processing.

² Newfoundland and "Publishing (only) of Periodicals" are excluded in columns 1, 2 and 3, but are included in columns 4, 5 and 6.

Exclusive of Newfoundland in columns 4, 5 and 6, 6 Exclusive of Newfoundland in columns 4, 5 and 6, 6 Exclusive of Publishing (only) of Periodicals' in columns 1, 2 and 3. 5 Due to the changes of establishments from one industry to another figures for 1949 are not comparable with previous years.

Consumption of Manufactured Products. - One of the beneficial results of adopting the same classification for external trade and for production is exhibited in Table 6, where the value of commodities made available for consumption in Canada is derived from these statistics. For example, the value of all manufactured commodities made available in 1956 was \$23,014,011,922, a figure obtained by adding to the value of manufactured products the value of the imports of manufactured and partly manufactured goods and deducting the value of the exports. In this table more accurate statistics could be presented were it possible to exclude from the gross value of manufactured products the duplications involved when the products of one manufacturing establishment become the material worked upon in another. Iron, vegetable, wood and paper, non-ferrous metals, non-metallic minerals, textiles and animal products were, in that order, the leading groups in the value of finished products made available for consumption in 1956.

Animal, wood and paper and non-ferrous metal products were manufactured in Canada in greater quantities than required for home consumption, providing export balances in these grouns.

On balance, Canada in the past imported large quantities of iron and steel, textiles, chemicals and non-metallic mineral

products in spite of large home production. The expansion of the iron and steel, chemical and non-metallic mineral products industries will enable Canada to meet more of her requirements for home consumption and to export greater quantities in the future.

Significant changes have taken place since 1939 in the type of manufactured products made available for consumption, In that year, the iron and its products group was in leading position and contributed 19.8 per cent of the total value of manufactured products. In 1956 this group was still in first place, but the percentage went up to 29.4. The wood and paper products, non-ferrous metals, non-metallic minerals and miscellaneous industries groups also increased their share of the total, while chemicals and allied products remained practically unchanged. The three mineral groups, combined, increased substantially their share of the total from 35.9 in 1939 to 50.2 in 1956. This indicates a higher standard of living for the Canadian people and also reflects the great expansion and diversification in manufacturing which has taken place since 1939. The industries producing consumer goods, on the other hand suffered a relative decline. Vegetable products dropped from 19.6 to 12.9, animal products from 11.8 to 8.1 and textiles from 13.3 to 8.3. The following table gives the relative position of the major industrial groups in 1939 and 1956.

Manufactured Products Made Available for Consumption

(Percentage of the Total)

Group	1939	1956	Group	1939	1956

¹ For 1952 and subsequent years the figures are "selling value of factory shipments" instead of "value of products manufactured".
² Figures for the years 1928-38 are for the fiscal years ended Mar. 31 of the following years: for 1939-56 they are for the calendar year.
¹ imports are total imports less foreign products re-exported,
³ Consumption figures for the major groups of the Standard Industrial Classification cannot be calculated as statistics of imports and experiments are still compiled on the component material classification basis.

SECTION 2. VALUE AND VOLUME OF MANUFACTURED PRODUCTS

Value of Manufactured Products. — In the interpretation of manufacturing values over a number of years, variations in the level of prices must be borne in mind. In recent years, due to violent changes in prices, unadjusted value series, used in isolation, have become increasingly inadequate as indicators of economic trends. Of necessity, interest has shifted to measures of volume. The range of prices since 1917, on the base period 1935-39 = 100, was as follows:

Year	General Wholesale	Fully or Chiefly Manufactured Products
1917	148.9	150.9
1920	203.2	208, 2
1929	124.6	123.7
1933	87.4	93.3
1939	99.2	101.9
1949	198.3	199.2
1953	220.7	228.8
1956	225.6	231.5

Volume of Manufactured Products. — Since real income is ultimately measured in goods and services, the growth of the volume of manufacturing production, as distinguished from its value, becomes a matter of great significance. The important thing to know is whether consumers are getting more goods and services, and not whether they are expending more dollars and cents. The field of industrial production, because of its dominating position in the national economy, has attracted increasing attention. This, in turn, has resulted in the need for more accurate measurements of physical output.

During the past few years, the Business Statistics Section of the Bureau's Research and Development Division has been engaged in the reconstruction of the Index of Industrial Production. The project consisted mainly of establishing annual gross and net levels of production for each industry from census of industry data and of improving the reliability of the current monthly series. For a description of the methods used in constructing the indexes and a description of its scope, see D.B.S. Reference Paper No. 34 "Revised Index of Industrial Production, 1935-1951".

The construction of this index was made possible by the availability of a great deal of basic data. Annual statistics valuable for this project have been collected by the Bureau without interruption from the end of the first World War to the present, and the scope of the monthly information has been greatly expanded. Applying the methods developed through the experience of the last quarter century, it has been possible to compute an index with a fair measure of accuracy from 1935 to the present.

Prior to the end of the first World War, the movement of industrial production was regarded as following the output of a few factors such as pig iron. The introduction of the index number placed the information on a much wider base. It is safer to base one's impression of the current trend upon a comprehensive index embracing a wide range of economic factors than upon any limited group of components that necessarily fluctuate according to particular influences.

An index of this kind offers considerable advantage in analyzing social and economic problems. The greatest call for the index is for the interpretation of current economic conditions. It is particularly relevant in the study of business fluctuations. While the index is based on the sectors of the economy that are particularly sensitive to short term influences, it also reflects a large part of the variations in the total of all economic activity. The output of mines and factories plays a dominant part in economic fluctuations and is closely associated with transport and trade which are mainly concerned with the distribution of commodities. The barometric nature of the industrial sector enhances the value of the index as an indicator of short-term movements but its usefulness in the interpretation of long-term economic developments should not be overlooked.

The Canadian annual Census of Industry, from which final benchmark indexes are computed, covers practically all establishments, but excludes work in the home. In the matter of repairs, the census of manufactures generally excludes work performed in connection with a service trade such as boot and shoe and automobile repairs. However, the census covers repairs carried on essentially under industrial conditions, such as ship and locomotive repairs. Consequently only industrial-type repairs are included in the index.

The framework of the revised index is based on the new Standard Classification of Industries prepared by an inter-departmental working committee. The preceding system used by the Bureau of Statistics was of a three-fold nature based on (1) chief component material; (2) purpose and (3) origin. The first principle was used most extensively, the criteria of purpose and origin having been used for the presentation of supplementary series which played a secondaryrole in Bureau publications.

The main innovation introduced in the Standard Classification was the compromise between the different principles. In recent years, Canada's industrial system has undergone considerable development, from a country primarily concerned with the early stages in the processing of primary materials to one that is turning out more and more goods for final consumption. Consequently, in establishing the new classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. The purpose phase was regarded as most appropriate for the wide range of consumer goods such as clothing and foods and beverages.

The industries grouped under the component material phase of the classification from 1935 to 1948 were re-arranged to conform with the standard model. As most of the industries were not greatly affected by the change in classification they were transferred intact to the proper position in the new system. The standard classification, for the most part, provided for comparability at the industry level. It was applied to establishments for the first time in the 1949 census of manufactures. In a number of industries, where the change in classification seriously disturbed the continuity, establishments were re-combined for the whole period covered by the index. The manufacture of synthetic rubber, for example, was transferred from the rubber industry to "miscellaneous chemicals". Plants engaged in the production for distribution of manufactured gas were transferred from "coke and gas" to the gas and electricity division. The salt industry was adjusted so as to comprise only processing operations for inclusion in the manufacturing division of the index. Three minor industries which were reclassified to non-industrial groups were dropped from the comnutation.

The appropriate series in the manufacturing division were re-classified to obtain sub-indexes of economic significance. The movement of durable goods normally varies from that of non-durables. There tends to be greater fluctuation in durables from prosperity to depression, the demand for non-durables being more constant. The manufacturing division was therefore divided, at the major group level, as between durable manufactures and non-durable manufactures. Although these groupings are rather rough and ready, they are of great use in economicanalysis. The classification into producers' and consumers' goods, attempted in some countries, involves more difficulty as many intermediate commodities have alternate uses, and was not attempted here.

Volume of Production, 1923-35. — The indexes of volume of production, 1923-1935 given in Table 7 below were constructed in the General Manufactures Section of the Industry and Merchandising Division for the years 1923 to 1946. On comparing the index for 1935 given in Table 7 which stood at 87.9 with the new index for 1935 at 86.5 given in Table 8, it would appear that for the back years little significant variation existed between the two series. The indexes in Table 7 may therefore be used in evaluating the changes in the volume of manufacturing production between 1923 and 1935.

The physical volume of manufacturing production increased 50 p.c. from 1923 to 1929. When it is recalled that the population of Canada is estimated to have increased only 11 p.c. during the same period, the growth of manufacturing production is indeed remarkable. Of this advance, the part resulting from an increase in the domestic demand due to growth of population would therefore be about 11 p.c. Exports of partly and fully manufactured goods increased from \$591,830,000 in the fiscal year ended Mar 31. 1924, to \$686,876,000 in the fiscal

year 1929-30, the increase in exports representing about 3.6 p.c. of the 1923 production. The remainder of the increase in production by 1929, or a margin equal to roughly 35 p.c. of the volume of manufactures of 1923, was, therefore, apparently absorbed by increases in capital equipment and by the rise in the standard of living of the population of Canada. From a high of 101.4 in 1929 the volume of production declined to 67.6 in 1932 and climbed again to 87.9 in 1935.

TABLE 7. Indexes of the Volume of Manufacturing Production, According to the Component Material Classification, 1923-35
(1935-39=100)

Year	Vegetable	Animal	Textiles	Wood and paper	Iron	Non- ferrous metal	Non- metallic mineral	Chemicals	Miscel- laneous	All industries
1 923	62.6	75.0	64.3	65.1	81 - 5	42.7	81.8	59-2	99.5	67.5

1 928	93.5	92.9	87.0	92.5	117.1	75-3	116.3	82.7	110.5	95.8
1929	96.4	87.9	86.1	99-6	133.4	81.3	137.1	84-8	105.6	101-4
1930	91.6	85-3	80-0	92-1	108.6	76.8	122.9	74.9	87-8	91.9
1931	83.4	77.4	78.2	76.6	82 - 8	73.1	105.6	69-2	80.0	79.9
1932	74.1	76-7	74.6	68. 0	53 - 5	58-9	75.1	66.0	75-8	67-6
1933	72.8	79.6	81.1	69.6	50.2	57-6	68-8	69-9	71.9	67.7
1934	82.4	86-5	89-5	81 - 5	67-6	70.8	82.5	79.3	85-2	79-6
1 935	87.0	91.3	94.5	89.5	83 - 4	81.2	88-1	87.2	91 - 1	87.9

Volume of Production, 1935-1955.— The period covered by this report was characterized by unprecedented industrial expansion. Emerging from a depression practically world-wide in scope, industrial operations in this country entered a period of rapid growth which was maintained throughout the war and post-war years without important interruption.

A problem confronting business economists is to determine how much of the post-war industrial "drive" was due to normal growth factors and how much of it was caused by the backlog of war accumulated demand. While it is true that the greatest demand accumulation took place in housing and consumer durables, non-durables such as textiles and clothing also started the post-war period with a sizeable backlog of unfilled demand. It is now becoming apparent, after the vigorous pace of business following the outbreak of hostilities in Korea, that a considerable portion of this demand has been satisfied and some industries, notably textiles, clothing, agricultural implements and some major appliances, are experiencing difficulties. However, overall prospects appear bright for the near future. The high level of capital investment during the past few years which increased productive capacity, is beginning to be reflected in current production statistics. Huge expansion and development programmes are still under way in iron ore, aluminum and other metals, oil, chemicals, electric power, and in a number of other industries. In addition, federal government expenditures for national defence should still exert some influence on the economic picture.

The volume of output of manufactures rose steeply after the outbreak of hostilities in 1939. Productive facilities responded quickly to the urgent requirements of the arme forces. In the early days of the war, production assignment alloted were comparatively simple, but as the pre-war weapore became absolete and as Canada proved herself capable turning out larger and more complex equipment, the assignment constantly shifted, changed and grew more difficult. The production figures merely suggest the magnitude of the achievement. They cannot describe the tremendous effort needed convert a semi-agricultural country into a wartime arsenal not the complications which arose because of shortages of mapower, tools and materials.

The productive peak was reached in 1944, when weapor supplies and equipment were rolling off the assembly lines record-breaking pace. The end of hostilities and the subseque reconversion to peace-time production were attended wi declines in output in 1945 and 1946. The upward trend w resumed, however, in 1947. The rate of advance slacken moderately in 1948 and 1949 but regained most of its 19 impetus in 1950 when the renewal of hostilities in Korea sulted in heavy anticipatory buying on the part of consum; and in growing expenditures for national defence. A remarka: feature is that in 1952, the index of the volume of manufact ing production which stood at 246.3 had surpassed the reci wartime level of 242.3 established in 1944. The index contued to advance in 1953, reaching a record high of 263.01 1954 there was a minor recession and the index droppedo 251.4. With the upturn in economic activity which occurred 1955 and 1956 the index rose again to an all-time high of 280, exceeding the previous high of 1953 by 8.7 p.c.

TABLE 8. Indexes of the Total Volume of Manufacturing Production, Classified on the Basis of Durable and Non-Durable Goods, 1935-1956

(1935-39=100)

Year	All manufactures	Non-durable manufactures	Durable manufactures
935	86.5	89.0	82.7
936		97.1	93.1
937		106.7	
938		98.9	113.2
939			103.2
940		108.2	107.9
		124.6	149.7
941		148.7	218.5
942		169.4	288-1
943	. 234.5	171.5	333.0
944	. 242.3	179.8	340.1
945	209.8	176.3	262.1
946	. 189.9	180.2	205.1
947	. 207.7	191.2	233.5
943	. 215.5	197.1	244.4
949	. 217.0	198.2	246.3
950	. 228.1	208-3	259.1
951		214.0	285.9
952		215.2	294.9
953		224-1	323.9
954		221.7	297.7
955		235.2	324.8
956		245.6	348.9

Non-durable Manufactures

The trend of output in the non-durable sector of manufacturing was visibly smoother than in the durable sector. Except for three years, 1938, 1945 and 1954, there has been no interruption in the upward movement of production during the period under review. Despite the fact that war contracts quickened the pace of output in some of the industries, production continued to expand after the war, although at a slower rate. Unlike durable goods, non-durable commodities are mostly consumers' goods and are less influenced by sudden changes in the international situation or the capital investment programmes of producers and governments. By 1956 the non-durables index of output had reached 245.6, the highest on record.

The production of processed foods and beverages rose without pause throughout the period. A characteristic of most nanufactured foods industries is the high ratio of the value of materials consumed to the value of products, indicating a relatively low degree of fabrication per unit of output. The advance in the production of beverages was practically uninterrupted rom 1935 to the present. In 1956, the volume of output was nore than 3 times what it was in the base period. The largest ncreases were recorded in the aerated waters and brewing ndustries. The indexes of these industries attained levels approaching 425 and 387 in 1956: Wine production, after reachng a peak in 1947, dropped 36 per cent in the following three years. Some recovery was recorded during the next few years ind in 1956 the output of new wine was 90 p.c. of the 1947 reak. Output of liquor climbed steadily until 1946 when the ndex reached 209. During the next four years, the volume of broduction fluctuated within narrow limits and in 1952 advanced tharply to an index level of 260, with a further rise to 290 in 953. After declining moderately in 1954 the index rose again o 336 in 1956.

The great demand for cigarettes for members of the armed orces during the war contributed largely to the considerable pcrease in the tobacco products index which reached the record evel of 230 in 1945. The index dropped to 204 the following ear, but rose gradually thereafter to 228 in 1950. Weakening lemand led to a decline of 7 per cent in 1951. Rapid recovery ras made during the next four years with the index rising to 25.5 in 1956, highest on record.

The contribution of the "Rubber Products" industry to the war effort was mainly in the form of tires and tubes for military vehicles and aircraft. Production of passenger car tires and tubes was sharply curtailed as was the output of rubber footwear. After marked increases in 1940 and 1941, the index remained more or less stationary at around 150 until 1945 when civilian production was resumed and the index jumped to 180. The industry-wide strike in 1946 contributed to a decline in that year, but record-breaking demand for the industry's output led to sharp advances in the following years, and in 1951 the index had reached the maximum level of 264. During the next few years the index fluctuated moderately and in 1956 climbed to 318.

Output of leather products rose steadily until 1946 when the index reached a high point of 168. The subsequent easing of foreign demand for the industry's products contributed to the gradual decline of production in the post-war period with the result that this group has shown the smallest growth of any in the manufacturing sector. In 1956, volume of output was only 48 per cent greater than in the base period, Production of leather tanneries in 1954 was actually 4.0 p.c. lower than in 1935-39, while the output of boots and shoes was 48 per cent higher, Some recovery was made in 1955 and 1956, the output of tanneries increasing 14 p.c. and footwear 69 p.c. over the base period. Since 1946 the overall index of this group dropped 12 p.c.

The textile (ex. clothing) industries reached their maximum wartime level of output in 1942 when the net index stood at 187. Production then fell off gradually until 1946 but recovered sharply in the post-war period to an index level of 212 in 1950. A slackening of demand for textiles during the next few years saw the index drop to 188 in 1953, with another sharp drop to 161 in 1954. Of all the industries of the non-durable goods sector, textiles were the hardest hit by the downturn in manufacturing activity in 1954. In 1955 there was substantial recovery and the index which rose to 185 was still, however, some 13 p.c. below the 1950 high. In 1956 there was another minor decline of 1.6 p.c. The movement of individual industries within the group has varied over the period. After reaching its highest level in 1942 the production of cotton goods declined steadily until 1947. After varying but fractionally in 1948 and

1949, output jumped 16 per cent in 1950, and remained practically unchanged in 1951, the recession in the last six months of the year just about offsetting the gains recorded in the first half. With continuing adverse conditions, the index dropped to a post-war low of 115 in 1954. The recovery made in 1955 and 1956 brought the index up to 134, still some 28 p.c. below the record of 187 attained in 1942.

Since 1938, the production index for synthetic textiles showed an unbroken record of increases and in 1951 stood at 393. The adverse conditions prevailing in the textile industry generally during the past few years also affected the output of synthetic textiles. By 1954 the index dropped to 290 with an increase to 331 in 1955 and a decline to 308 in 1956 Much of the credit for increasing consumer acceptance of synthetics belongs to the achievements of research in improving manufacturing and dyeing techniques and in the development of new combinations of various fibres with a new range of qualities and practical applications.

Synthetic fibres are now being used in the fabrication of a host of commodities such as suitings, overcoatings, blankets, carpets, draperies, upholstery products, tire fabrics, etc., in addition to hosiery, dress fabrics and other women's wear. Moreover, Canadian producers are now supplying the bulk of domestic synthetic raw material requirements which were formerly imported from the United States. As a result, new investment outlays by the industry have increased considerably in the post-war period.

The trend in the physical output of clothing was similar to that of other textiles, the production index reaching a peak of 162 in 1942, then declining gradually until 1945. Since then output fluctuated within narrow limits, dropping to a post-war low of 150 in 1951 and a high of 167 in 1953. The general decline in production in 1954 saw the index drop to 145. The recovery in 1955 was only moderate, the index rising to 149 with a further rise to 156 in 1956. The industry is now facing keen competition and a more selective retail demand. By improving manufacturing methods and styling, the industry hopes to make available more desirable merchandise at lower prices, Weak demand contributed to a marked decline in the level of new investment in durable physical assets. Funds expended for new plant, machinery and equipment dropped from \$15.7 million in 1949 to an average of \$13.0 million during the next four years. From 1954 to 1956 investment dropped to \$9.4 million per annum.

Production of paper products advanced sharply in the postwar period. The level of the index remained relatively steady from 1941 to 1944, but increased 54 per cent in the succeeding seven years to a record figure of 248. In 1952 the index dropped to 236 and increased to 268 in 1955. Activity in this sector of manufacturing is influenced mainly by the "Pulp and Paper" industry, which, in terms of value added, is the most important single manufacturing industry. In the last few years, the net value contributed by pulp and paper mills was almost twice that of any other industry. The growth of this industry during the period under review was characterized by two distinct phases. From 1935 to the end of the war, new investment by the industry was designed mainly to replace worn-out machinery and equipment and increases in output were principally the result of utilizing idle capacity after the depression of the thirties. Since 1945, however, with strong world demand for wood pulp and newsprint, together with the availability of necessary materials for expansion, the construction of new plant and the installation of new machinery and equipment reached record proportions. Investment in new plant and equipment, which averaged \$105 million during the previous three years dropped to an average of \$70.0 million in 1954 and 1955, a decrease of \$46 million from the record high reported in 1952. In 1956 capital investment reached the unprecedented total of \$134 million.

Newsprint, pulp and paper board are the leading products of the pulp and paper industry. Production of newsprint in 1956 totalled 6,445,110 tons of which 5,967,194 tons were exported.

Canada is thus the leading exporter of newsprint in the world. World exports of newsprint in 1954 are estimated at 6,788,000 tons, with Canada accounting for 81.3 p.c. of the total. Finland, Sweden and Norway, in the order named, are other substantial exporters of newsprint and between them have accounted for 10.5 p.c. of the total. Newsprint is also Canada's leading export and 1956 was valued at \$708,384,822.

The printing and publishing industries expanded very little during the war years. In 1944, output was only about 15 per cent greater than in the base period. Production grew rapidly after the end of hostilities and in 1956, volume of output was more than double what it was in the five pre-war years, although this represents a substantially smaller advance than total manufacturing. The post-war increase coincided with the gain in the value of new investment which was mainly in the form of machinery and equipment to make up for deficiencies dating back to the depressed thirties and the war years. Investment in fixed assets totalled \$16 million in 1953 and \$27 million per annum in 1954 to 1956 as compared with only about \$2 million in 1944.

With few interruptions, output of petroleum and coal products rose steadily over the period under review to an index of 442 in 1956. Although production of coke failed to exceed its record wartime volume, petroleum refining, as the result of record-breaking post-war demand for gasoline and fuel oils, showed a marked expansion. In 1956, the production index stood at 552 compared with a wartime high of 170 in 1944. In recent years, the industry has added substantially to its refining capacity. From 1947 to 1951, expenditures for new plant, machinery and equipment which averaged more than \$37 million a year rose to \$84 million during 1952, 1953 and 1954 and to \$107 million in 1955 and 1956. Some of this rapid growth is associated with the remarkable progress made in the exploitation of western crude oil reserves. In 1956, oil from domestic wells represented 54 per cent of the total consumed by Canadian refineries. This compared with a contribution of 22 per cent in 1949.

Output of chemical products which include ammunition and explosives reached a record-high level in 1944 when the index stood at 390. Production in the post-war period has been at a considerably lower level, but increased significantly since 1950, with the advent of the defence programme. The index in 1956 stood at 301. The expansion of the industry during the war made possible the manufacture of many products which were formerly imported. In addition, several entirely new products such as synthetic rubber, were introduced. Demand for these commodities continued in the post-war period and the development of new sources of basic materials, together with the progress of research into additional commercial uses for these new compounds resulted in further expansion of production for civilian use.

The rapid wartime advance was mainly the result of the enlargement of the munition programme with the government and private industry combining forces in the construction of inuge explosives and ammunition-filling industry. At its pea in 1943, the production index for explosives and ammunition was 20 times higher than in the base period. Output droppe very rapidly after the end of the war and in 1946 the index was down to 107.

Since the Government-owned Polymer Corporation begaproducing synthetic rubber in 1943, output of this importation of the superscript of the supers

Durable Manufactures

The tremendous increase in physical output during the war years was mostly concentrated in the durable goods sector. When war was declared in September, 1939, there were virtually no armament works, no production of large ships and large planes, no guns, no tanks, Within a few years Canadian plants were turning out naval and merchant ships, warplanes ranging up to the 15-ton Lancaster bomber, military vehicles, millions of rounds of ammunition and hundreds of other war items. On the base of 1935-39 the new volume index of durable manufactures reached a peak of 340 in 1944. In the following two years it declined sharply and stood at 205 in 1946. Since then it has regained the lost ground, reaching 349 in 1956, 2.6 p.c. above the war-time peak of 340.

The largest gain occurred in the output of transportation equipment. Due principally to the tremendous increases in production of ships and aircraft, the index for this group of industries rose to the record level of 694 in 1944, the year of maximum war production. After reaching a post-war low of 222 in 1946, the index rose moderately during the next three years, but, spurred by the great demand for passenger cars and by the renewal of defence production, marked gains were made since 1950, with the index climbing to 436 in 1953. The minor recession in industrial production in 1954 affected this group more than any other. The index dropped to 355, a decline of 18.7 p.c. as compared with the previous year. In 1955 there was another minor decline with the index dropping to 351. This was the only group to report a lower volume output in 1955. In 1956 the index recovered to 372.

The iron and steel group of industries was also considerably affected by war requirements. As most of the industries in this sector were more firmly established in the pre-war period, they did not expand relatively to the same extent as shipbuilding and aircraft. When European supplies were cut off early in the war, the Canadian basic steel industry had to rely on the United States for a greater supply and had to increase its own steel-making capacity to meet abnormal wartime re-

quirements. However, development of the industry did not halt with end of hostilities. Canada's industrialization programme. together with strong post-war demand for consumers' durable goods, led to steady expansion of the industry so that by 1953, the index for the group stood at 291. Compared with pre-war, pig iron output had more than tripled, and steel ingot and casting production had risen by 170 and 74 per cent respectively. Due to the contraction in the demand for durable goods in 1954 the index for the group dropped to 252, down to about the 1947 level, Pig iron at 2,211,000 tons was down 27 p.c. and steel ingots at 3,195,000 were 22 p.c. lower, However, rapid recovery was made in 1955 and 1956 when the index rose to 328, only 9 p.c. below the record high of 362 attained in 1943. Production of pig iron in 1956 totalled 3,568,000 tons and steel ingots and castings 5,301,000 tons. The additional capacity constructed during the past few years should reduce still further the country's dependence on United States imports of finished and semi-finished iron and steel shapes. Indicative of the rapid growth of the industry in recent years is the amount of funds expended for new plant, machinery and equipment. From an average annual expenditure of \$62 million during the previous five years new investment jumped to \$136 million in 1952 and \$114 million in 1953. New investment in 1954 and 1955 averaged \$92 million and in 1956 reached the record total of \$159 million.

To meet the need for electrical and radar equipment and signalling devices, the "Electrical Apparatus and Supplies" industry manufactured articles during the war which were previously not made in Canada. Output of civilian radio receiving sets and appliances was severely curtailed as the industry converted the major part of its productive capacity to the manufacture of war instruments. The production index reached a wartime peak of 312 in 1944 and declined during the next two years. The industry recovered rapidly, however, as a result of accumulated demand for radios, consumers' appliances and heavy electrical equipment, and by 1952 the index had jumped 60 per cent from its 1946 post-war low, to a level of 393. Due mainly to the heavy demand for television sets, the index in

1953 advanced sharply to 487 an increase of 24 per cent over the previous year. In 1954 the index declined moderately to 478, but rose sharply in 1955 to an all-time high of 535, with a further rise to 550 in 1956.

reached a wartime maximum in 1943 when the net index stood at 285. During the next three years, output dropped 44 per cent, but recovered steadily thereafter, backed by sustained demand for base metals. In 1956 the index stood at 286. Aluminum which is an important component of the group is being fabricated into an ever-increasing variety of commodities, and production of aluminum bars and rods, sheets, shapes, etc., reached record proportions in the post-war period. During the war years, aluminum sheet production was of a strong alloy type used principally in aircraft construction and required more fabrication than the regular type of sheet used in the production of cooking utensils and other civilian items.

Military requirements did not affect the nature of output in the non-metallic mineral products group of industries. In war or peace, the bulk of production consists of construction materials such as cement, cement products, building brick, lime and gypsum products, glass, stone products, etc. During the war, under government control, a major proportion of these industries' products were channelled into construction of new war production plants, extensions to pre-war plants, housing for war workers and the building of training and operation facilities for the armed services. No serious reconversion problems were encountered by the non-metal industries immediately following the war. After a slight pause, following the peak of wartime

output, plants turned their productive capacity towards meeting the unprecedented demands of the post-war construction boom. From a wartime maximum of 212 in 1943, the volume index dropped moderately in 1944 and 1945, but rose steeply in succeeding years to reach the record level of 526 in 1956.

In the durables sector, the wood-using industries were the least affected by the war. The volume of output of wood products expanded steadily without any serious interruption throughout the war and post-war years. In 1953 the index stood at 235, the highest on record. In 1954 the index declined fractionally to 230, but advanced sharply the following two years to an all-time high of 257 in 1956. The two most important industries are "Sawmills" and "Furniture". The index representing the former, after reaching a wartime maximum of 140 in 1942, declined considerably in 1943, and hovered around 124 during the next two years. Beginning in 1946, output rose sharply, spurred by strong foreign and domestic demand for sawn lumber and by 1951, the index had advanced to 168, but declined to 164 in 1952. Considerable improvement took place since then with the index advancing to 199 in 1955. Exports of planks and boards, shingles and veneer and plywood were considerably lower in 1956. This is reflected in the moderate decline of the index to 193. Production in the furniture industry expanded throughout the period under review. The great increase in residential construction in the post-war period, together with the marked gain in new family formations created a boom for producers of house furnishings. Output of furniture jumped sharply in the three years immediately following the end of the war and rose more gradually during the subsequent period.

SECTION 3. PRODUCTION BY INDUSTRIAL GROUPS AND INDIVIDUAL INDUSTRIES Subsection 1. Manufactures Grouped on the Standard Classification Basis

Three important changes have been made during the past few years in the methods of collecting and compiling the returns of the annual survey of manufactures. First was the adoption in 1949 of the Standard Industrial Classification. This new classification superseded the classification formerly used by the Bureau, which was based on the nature of the materials used by manufacturing establishments.

For most purposes, a classification of manufacturing industries based upon "chief component material" has in the past proved most useful in Canadian industrial classification. The Bureau's classification based on this concept has been the one most widely adopted for general purposes, such as the decennial census, foreign trade, industrial statistics, etc. Even for these purposes some modification has been deemed expedient, such as the inclusion of such a group as "Textile Products" comprised partly of animal and partly of vegetable products.

When the industry of a country is primarily concerned with the early stages in the processing of primary materials, which form final products such as pig iron, lumber or processed fish, a classification based upon chief component material is wholly applicable. As manufacturing industry develops, however turning out more and more goods for final consumption, the combination of ingredients in such production becomes more and more complex. The modern automotive, aircraft, shipbuilding and electrical apparatus industries are examples in which a wide variety of materials must be assembled for the compilation of the final product. For this reason, the application of the component material classification became increasingly more difficult as Canadian manufacturing production developed and diversified.

In establishing the Standard Industrial Classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. For the classification of consumers' goods industries, the concept of "purpose" seems most applicable both in terms of common usage in referring to industries and in providing the type of data most often required. Hence, such major groups as Foods and Beverages, Clothing, Transportation Equipment, Electrical Apparatus and Supplies, have been established. Some industries were broken down, such as the electrical apparatus and supplies which now comprises five industries - (a) batteries, (b) heavy electrical machinery, (c) radios, television sets and parts, (d) refrigerators, vacuum cleaners and appliances, and (e) miscellaneous electrical products. In some cases, establishments were transferred from one industry to another in order to bring them in line with the new industries which were established. Where an industry was eliminated, the establishments were transferred to one or several industries, depending on the nature of the principal products manufactured. A check was also made of all establishments and many transfers were made where the major products of the establishment had changed materially during the years. By and large, little change was required for most industries, the only change being a transfer to the new major groups which were established.

In the Standard Classification adopted in 1949 the industries are now grouped into seventeen major groups listed in Table 11, instead of the nine groups listed in Table 13 which were formerly used as the main basis of classification. The grouping used in Table 11, where the statistics of individual industries are presented in detail, and in the historical series shown in Table 3 is, therefore, on the basis of the new Standard Industrial Classification. However, to retain some basis of continuity with the past, there is a less detailed analysis given in Table 13 on the component material classification basis, while Table 14 gives the industries on the basis of the origin of the materials used.

The second major change was the adoption of the short form in 1949, which goes a long way in relieving small manufacturers from the irksome duty of filling in complicated and detailed returns to the Bureau.

The growing complexity of modern economic life compels governments to obtain more and more data on which to base their economic policies and for the efficient discharge of their responsibilities in the ever-widening field of activity. To get this information is expensive and also throws a burden on industry in general, which of necessity must be called upon to furnish the desired data. Realizing this, and also the fact that the necessary information must be secured, the Bureau has been casting about for new statistical techniques which would lessen the burden on industry and also would, at the same time. secure substantially correct data for the use of the administrator. With manufacturing statistics, unfortunately, the sampling techniques are difficult to apply. Other methods, therefore, had to be adopted in order to lessen the burden of the smaller manufacturer at least and, at the same time, secure substantially correct results. It was found, for example, that in 1949 out of 35,792 manufacturing establishments, 21,060 with a value of production of \$50,000 or less, contributed only 2.6 p.c. of the total value of production. On the surface it looked obvious that the Bureau could exempt these 21,000 establishments from making annual returns and still obtain satisfactory results. This would be true if we were only interested in the total value of production or the total value of materials used. This, however, is not the case, as the users of the statistics are also interested in the details of the products made and the materials used. By a study of each industry it was found that by exempting the smaller establishments in some industries, that for some commodities produced or materials used there would be a 50 p.c. loss of the total. Complete exemption was therefore out of the question. New methods had to be designed to relieve small establishments of the difficult task in furnishing information. A study was therefore made of each industry classification, of which there are about 200, and different cutoff points were determined for different industries, The general rule adopted was that wherever possible establishments with a value of production of less than \$50,000 per annum should only be required to furnish that one figure to the Bureau, and that on the basis of the information received from the smaller establishments in 1948, the last year for which they were required to furnish complete details, the Bureau would estimate for each small establishment individually the number of employees, salaries and wages paid, as well as the value of materials used. This is done in order to have a hollerith card for each establishment to use in the compilations on a geographical basis. In addition to the principal statistics, details of materials used and products made by the short-form firms are also made for each industry, by province. These estimates are based on the detailed statistics supplied by the small establishments in 1948. These estimates cannot be far out, as in most industries the percentage that these smaller establishments contribute to the total for the industry is only from 10 to 20 p.c. Where it was found that there would be a great loss in commodity data, instead of asking only for the gross value of production, the smaller firms were required to fill in a shorter form which lists the commodities in which there would be a substantial loss if no information was obtained from small firms. In other cases the cut-off point was reduced to \$25,000 or \$15,000.

An important change was made in the annual census of manufactures for 1952. A shipments concept instead of the value of production statistics heretofore compiled was adopted for a large number of industries where it was known that inventory changes from year to year were only of a minor nature. The concept was not changed for industries known to experience wide fluctuations in inventory holdings, pending further study for the need of both production and shipments information. By 1954 the shipments concept was implemented for almost all industries, Industries for which production statistics are still

required are asked to report the detail of products made in physical quantities only and at the same time are required to report details of their shipments, giving both the quantity as well as the selling values at the plant. In a few industries such as sawmills, veneer and plywood, etc., production statistics only are still collected, the products made being valued on the basis of average selling prices during the current year.

The aim of the new Census of Industry schedule is to ease the burden of filling out Bureau questionnaires. The value of shipments concept for small and medium sized establishments is more realistic and more readily obtainable from the accounting records of firms, whereas the value of products made, for firms not recording such information, must be derived from special calculations. The value of shipments provides a standard basis of reporting for all establishments. Under the old system some establishments reported the value of products made and others the value of factory shipments, even though the schedule required products made to be reported. This was especially true for small and medium sized establishments. Further, a great number of firms, attempting to report production values to fulfil the requirements of the old questionnaire, in fact computed their cost of production rather than their selling value, as they were supposed to. Since the value of shipments is usually carried in the firm's accounts, the work of filling out reports should be lessened and the questionnaire should as a result be filled out more promptly. The change should ease the burden for small establishments in particular, since the value of sales is readily available from their accounting records.

Under the "value of products" concept, establishments were required to report the factory selling value of the products made, whether sold or not, the unsold portion being assigned the average selling value of similar articles sold during the year. Where no selling values were available for the unsold portion estimated values had to be assigned. Under the new concept establishments are required to report their sales during the year, regardless of when the products were made.

These two concepts give different results, the first gives the value of products made and the second the value of products sold. For a large number of industries where normally there is no significant changes in the opening and closing inventories of finished products, these two sets of figures may be used interchangeably as they both reveal more or less the value of production and are, therefore, comparable with figures for previous years. There are, however, a number of large key industries with substantial changes in their opening and closing inventories. In such industries the new concept gives quite different results to that obtained formerly. To get comparable figures, the shipments figures must be converted to a production basis by adjusting for inventory change.

The change to the new concept solved the problem of uniformity of reporting inasmuch as the smaller firms who previously were reporting shipments instead of production are now reporting correctly. However, the new method has created other problems. One of these is the calculation of "value added by manufacture," which is obtained by subtracting from the value of production the cost of materials used, including the cost of fuel and electricity. Since the value of production is not now being reported, it has to be calculated by using the following formula.

"'Shipments plus closing inventory of finished products and goods in process minus the opening inventory of finished products and goods in process equals value of products made." In order to enable the Bureau to calculate "value added," it became necessary to ask firms to report their opening and closing inventories, broken down into (a) raw materials, (b) goods in process, and (c) finished products. These questions were added to the form for the 1954 census. As the schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added by manufacture is obtained by subtracting from the shipments the cost of materials used, including fuel and electricity.

In theory, adjustment should also be made for the change in work in process inventory, and ideally the inventory adjustment should be on a "value of the physical change" basis rather than the "change in book value." However, it has not been possible to introduce these refinements at the present time.

Another difficulty has arisen in implementing the shipments concept in the case of multiple unit firms that ship the products from the various plants to a central warehouse, located in another city, where the selling function of the firm is performed. In such cases the goods leaving the plant are considered as being shipments under our definition even though the ownership still remains with the reporting firm. Such firms are considered as performing two distinct functions - (a) manufacturing, and (b) distributing - and these two functions are treated statistically as if they were performed by two different organizations. In many cases no stock is held at the plant; consequently shipments and production reported on a plant basis are one and the same. We therefore are still getting production figures from firms that sell from a central warehouse. Where the manufactured products are billed to the warehouse, the firm is required to report the total of such billings during the year. In some cases the production and distribution functions are treated in the accounting records as a unified operation, no charge being made to the warehouse of the products shipped. In such cases firms are instructed, if possible, to report the shipments on a cost of production basis, with a percentage mark-up for profits. The aim of the Division is to get companies to report their shipments on the same basis as if they were selling to an independent wholesaler.

Having received a return from all manufacturing establishments and the value of their products totalled, the question now is "What does this total mean?" The truth of the matter is that a total value of production for a group of industries or all industries for a single year has no significant meaning. To add the value of production of flour mills to that of the baking industry would give an inflated value of production since part of the flour which was sold to bakeries is valued twice, first as a product of flour mills and again in the cost of bread. For example, if a flour mill would produce \$1.00 worth of flour and sell it to a baker, the baker would use this dollar's worth of flour, and after further processing would sell it for \$2.14 according to the experience of the baking industry for 1954. According to the statistics obtained for that year for every dollar's worth of materials used the products made were valued at \$2.14. When you add the production of these two establishments, you get a value of \$3.14. There is thus duplication where the products of one establishment become the raw materials of another establishment. However, in the present issue, the totals of gross value of production or shipments are shown as a matter of historical interest.

A more meaningful indicator had to be evolved to measure the importance and wealth created by an industry or group of industries. This was found in the concept "value added by manufacture." This figure is obtained by subtracting the cost of fuel and electricity as well as the cost of materials used from the gross value of the products, and represents the values added to the raw materials while they are in the factory. Such added values constitute the real production of the manufacturing plant and are alone available for the payment of salaries and wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met, as well as profits. The value added by manufacture reported by the various industries can be added to produce a non-duplicating total for manufacturing as a whole. Being free of duplication, within the manufacturing sector value added figures are therefore more representative of the total value of manufacturing production than the gross value of production figures.

The concept of "net value" is also important in evaluating the importance of an industry as a creator of economic wealth. Usually the gross value of production is used in ranking industries. This method has the defect of overevaluating industries that use expensive raw materials which undergo little processing. The following table ranks the fifteen leading industries in 1954 on the basis of "gross" and "net" value of production.

	Selling va factory shi	lue of pments	Value adde manufact	
	Amount	Rank	Amount	Rank
	\$'000,000		\$'000,000	
Pulp and paper	1, 241. 6	1	641.1	1

Rubber goods (including footwear)	264.2	14	149.0	10
Printing and publishing	256. 7	15	182.9	6

In interpreting the statistics of individual industries, it should be remembered that the figures on employment, production, etc., do not refer to individual products but to all the products made in an industry. For example, the value of production of the confectionery industry, amounting to \$104,853,748 in 1950, does not imply that this was the value of confectionery produced. What it means is that the firms whose principal product is confectionery had a value of production of \$104,853,748. This figure, in addition to confectionery, includes all the subsidiary products made by these firms such as ice cream which was valued at \$2,214,689 and bread and other bakery products valued at \$2,457,312. Confectionery is also

produced as a subsidiary product by firms credited to other industrial classifications, For total production figures of individual products, reference should be made to "The Alphabetical List of Products" published annually as Appendix Π to this report.

Table 11 presents for the year 1956 detailed statistics regarding the individual industries under which all industrial plants in Canada are classified. The industries are further assembled under seventeen main groups according to the Standard Industrial Classification.

² This industry still reports "Value of production at the factory" and not "Selling value of factory shipments".

Table 12 gives the amount and value of each of the principal commodities produced or shipped by the manufacturing industries of Canada, Commodities produced in small quantities

are not included but the list covers approximately 75 p.c. of total production. For a complete list of products, see Appendix II of this report.

TABLE 12. Quantities and Values of the Principal Commodities Produced or Shipped by the Manufacturing Industries of Canada, 1956

Note: Since 1952 the basis of collection is "Value of Factory Shipments" instead of "Gross Value of Products". However, the commodities marked are still on a production basis.

Sporting goods Springs, bed and other furniture			

Subsection 2. Manufactures Classified on the Chief Component Material Classification Basis

For the most purposes a classification of manufacturing industries based upon "chief component materials" has, in the past, proved most useful in Canadian industrial classification. For this reason the Bureau's classification based upon this concept has been the one most widely used for general purposes such as the Decennial Census, Vital Statistics, foreign Trade, etc. Even for these purposes some modification has been deemed expedient, such as the inclusion of a group "Textile Products", composed partly of animal and partly of vegetable products.

When the industry of a country is primarily concerned with the early stages in the processing of primary materials, i.e., when its final products are chiefly such items as pig iron, lumber and processed fish, a classification based upon chief component material is wholly applicable. As manufacturing industry develops, however, turning out more and more goods for final consumption, the combination of ingledients in such output becomes more and more complex. The modern automotive, aircraft, shipbuilding, and electrical apparatus industries are examples in which a wide variety of materials must be assembled for the completion of the final product.

In recent years Canada's industrial system has undergone considerable development. Consequently in establishing the Standard Industrial Classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. For the classification of consumers' goods industries the concept of "purpose" seems most applicable both in terms of common usage in referring to industries and in providing the type of data most often required. Hence, such major groups as Foods and Beverages, Clothing, Transportation Equipment, Electrical Apparatus and Supplies, have been established.

TABLE 13. Principal Statistics of the Manufacturing Industries, Classified on the Chief Component Material
Classification Basis, by Main Groups, Significant Years, 1917-1956

Industrial group and year	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Gross value of products

¹ In 1952 the basis of collection was changed from "Value of products made" to "Value of factory shipments".

Subsection 3. Manufactures Classified by Origin of Materials

The distinction made between farm materials of Canadian and foreign origin is based on whether the materials are indigenous to Canada rather than on their actual source. Thus, the industries included in the foreign origin classes are those depending upon materials that cannot be grown in Canada, such as tea, coffee, spices, cane sugar, rice, rubber, cotton, etc. Industries included in the Canadian origin classes may, however, be using large quantities of imported materials.

The mineral origin group includes, in addition to nonferrous metals so largely produced in Canada, the manufactures of iron and steel, or petroleum, and of other mineral substances, the raw materials for which are very largely imported. Products of mineral origin, with the exception of fuels, are nearly all durable goods. A high standard of living and advanced indus-

trial organization is usually indicated by relatively large production and consumption of mineral products. During periods of depression when the production of capital goods is curtailed, employment in the industries of the farm group, which produce mainly consumer goods, exceeds that of the mineral group. The industries of the mineral group in 1943, at the maximum of the war effort, had by far the greatest capital investment, employed the largest number of persons, and paid out the highest amount in salaries and wages. In 1943 the average capital per employee amounted to \$5,441 for the mineral group as compared with \$4,417 for the farm origin group. The mineral group also pays the highest wages. In 1956 the average salary and wage was \$3,883 for the mineral group and \$2,849 for the farm origin group.

¹ For the year 1924 the figures for "Cost of Materials" and "Gross Value of Products" include the value placed on intermediate products used in further processes in the chemical group of industries. For this reason these figures differ slightly from those contained in the other tables of this report.

² In 1952 the basis of collection was changed from "Value of Products Made" to "Selling value of Factory Shipments".

Subsection 4. Manufactures Classified by Type of Ownership

The present report deals with the type of ownership under which Canadian manufacturers operate. The first survey in 1946 did not include the fish-curing and packing industry, information for which was not available at that time. For this reason the figures for 1946 are not strictly comparable with those for succeeding years, although the inclusion of that industry has not materially altered the percentage distribution of individual ownership, incorporated companies, etc.

Of the 37,428 establishments operating in 1956, 1,691 establishments in the periodical publishing industry were unclassifiable, leaving 35,737 establishments in the four

categories of ownership. Individual ownership numbered 14,788 establishments, partnerships 4,550, incorporated companies 15,497 and co-operatives 902. The percentage distribution of the four categories of ownership are given below for the years 1946 to 1956. It is interesting to note that incorporated companies are becoming increasingly important, the percentage of the total number of establishments having risen from 33.4 in 1946 to 43.4 in 1956, while the other three categories declined in importance. This trend to incorporation is no doubt accentuated by the favourable income tax rate allowed companies on the first \$20,000 of income.

Year	Individual ownership	Partnerships	Incorporated companies	Co-operatives
1946 (estimated)	47.3	16.0	33.4	3.3
1947	46.4	16.1	34.3	3.2
1948	46.2	16.4	34.4	3.0
1949	46.0	15.8	35.3	2.9
1950	45.6	15.0	36.3	3.1
1951	44.6	15.5	36.9	3.0
1952	44.9	15.4	36.9	2.8
1953	44.4	14.8	38.2	2.6
1954	43.6	14.3	39.5	2.6
1955	42.7	13.6	41.1	2.6
1956	41.4	12.7	43.4	2.5

As is to be expected, the smaller establishments, regardless of the type of products manufactured, are carried on under individual ownership. Industries conducted on a small scale contain therefore a large number of establishments in this category, the percentage decreasing as the scale of operations increases, as the following statement shows,

		to total
Wood products Printing, publishing and allied industries Miscellaneous manufacturing industries Foods and beverages Non-netallic mineral products Clothing Chenicals and allied products Leather products Iron and steel products Textile mills Knitting mills Non-ferrous metal products Paper products Paper products Products of petroleum and coal Electrical apparatus and supplies Tobacco products Transportation equipment Rusber products All groups	12. 2 15. 8 21. 5 22. 8 34. 0 35. 6 46. 7 48. 6 66. 5 73. 4 76. 6 96. 5 165. 0 165. 3 176. 1 188. 5 239. 0 254. 2	59. 0 42. 6 36. 1 45. 1 30. 4 26. 6 15. 6 27. 4 23. 9 30. 3 14. 7 23. 4 8. 1 2. 8 8. 0 29. 4 41. 4

It is therefore found, according to the above, that in the wood products group 59 p.c. of the establishments were under individual ownership. The foods and beverages group had 45 p.c. of its establishments in this classification, followed by the printing, publishing and allied trades with 43 p.c., miscellaneous industries 36 p.c., non-metallic mineral products 30 p.c., textile mills 30 p.c., tobacco and tobacco products 29 p.c., leather products, 27 p.c., clothing 27 p.c., transportation 26 p.c. etc. The petroleum and coal products group with only 2.8 of the total had the smallest number of establishments operating under individual ownership.

The establishments operating under individual ownership are not as important, from the point of view of employment provided, as their large numbers would indicate. According to tables 1 and 2, these establishments which comprise 41 p.c. of the total have only 5 p.c. of the total employees. Partnerships accounted for 13 p.c. of the number of establishments and

3 p.c. of the total employees. Incorporated companies with 43 p.c. of the number of establishments had 92 p.c. of the employees. Cooperatives with 2 p.c. of the establishments had 1 p.c. of the employees.

On the basis of employment provided, incorporated companies are, by a wide margin, the most important factor in the employment field. In the petroleum and coal products group practically 100 p.c. of the employees were reported by such companies, while the rubber, electrical apparatus and supplies, paper and transportation equipment groups had 99 p.c. Companies in the chemicals had 98 p.c., tobacco and tobacco products and non-ferrous metal products 97 p.c., iron and steel products 96 p.c., textile mills and knitting mills 95 p.c., nometallic mineral products 94 p.c., leather products 91 p.c., miscellaneous industries 88 p.c., printing publishing and allied trades 87 p.c., clothing 85 p.c. and foods and beverages 83 p.c. Companies in the wood products group with 76 reported the lowest percentage of the total employment.

TABLE 15. Percentage Distribution of Establishments in the Manufacturing Industries, Classified by Type of Ownership, by Provinces and Industrial Groups, 19561

Subsection 5. Leading Manufacturing Industries

In the following statement, the rank of the ten leading industries in 1956, from the standpoint of gross value of pro-

duction or value of shipments is compared with their respective ranks in significant years since 1922.

	Rank in								
Industry	1956	1949	1944	1939	1933	1929	1922		
Pulp and paper	1	1	5	2	1	1	2		
Non-ferrous metal smelting and refining	2	3	2	1	2	9	1		
Petroleum products	3	5	14	6	6	10	9		
Motor vehicles	4	4	7	5	11	4	6		
Slaughtering and meat packing	5	2	1	3	3	2	3		
Primary iron and steel	6	8	13	11	31	16	20		
Sawmills	7	6	11	8	14	5	4		
Butter and cheese	8	7	10	4	5	6	5		
Miscellaneous electrical apparatus and supplies	9	19	2	2	2	2	2		
Rubber goods, including footwear	10	15	15	14	4	11	21		

 $^{^1}$ Did not rank among the forty leading industries that year. 2 This industry was not classified separately but was included with electrical apparatus and supplies.

A prominent feature of Canadian Manufacturing development during the past twenty-five years has been the rapid growth of non-ferrous metal smelting. This industry, based upon the rich base-netal resources of the country, has taken its place among the leading manufactures, along with the industries based upon forest, agricultural and live-stock resources. Another feature of this development in manufacturing production is the rise of the petroleum products industry from fourteenth place in 1944 to third place since 1954. This is the direct result of the recent discoveries and development of the large oil resources of the Prairie Provinces and the rapid industrialization of Canada during the past decade.

The incidence of the depression resulted in a re-arrangement of the ranking of many industries which in some cases has proved to be temporary. During the war, the industries engaged in producing the equipment needed by the armed forces, such as shipbuilding, aircraft, automobiles, miscellaneous chemical products, and primary iron and steel, advanced to higher positions. When the war ended, the industries engaged in the production of consumer goods, by reason of the expanded demand for their products, bettered their position. Pulp and paper, after a lapse of a number of years, resumed its premier position.

The impetus given to Canadian manufacturing production by the Korean war is reflected in the advance of the aircraft industry to ninth position. This industry which did not rank among the forty leading industries before World War II was in fourth place in 1944 and sixteenth place in 1952. The shipbuilding industry also bettered its position as a result of the defence program occassioned by the Korean war. This industry which did not rank among the forty leading industries in 1949 advanced to thirty-fourth place in 1952 and 1954. With the slackening in defence spending, operations declined with the result that in 1955 and 1956 this industry, again, did not rank among the forty leading industries.

The recovery in 1955 and 1956 from the minor recession experienced in 1954 resulted in some major changes in the ranking of the leading industries. Volume output of durable goods industries advanced by 17.2 p.c. as compared with 10.8 p.c. for non-durable goods. Pulp and paper, non-ferrous metal smelting and refining, and petroleum products had the same rank in 1956 as in 1954. Motor vehicles advanced from fifth to fourth place, primary iron and steel from eighth to sixth place. miscellaneous electrical apparatus and supplies from thirteenth to ninth place, and rubber goods from fourteenth to tenth place. A number of the industries producing non-durable goods declined in relative importance. Slaughtering and meat packing dropped from fourth to fifth place, sawmills from sixth to seventh place, butter and cheese from seventh to eighth place, miscellaneous food preparations from tenth to thirteenth place. and aircraft from ninth to eleventh place.

TABLE 20. Principal Statistics of the Forty Leading Industries of Canada, Ranked According to Selling Value of Factory Shipments, 1956

SECTION 4. PRINCIPAL FACTORS IN MANUFACTURING PRODUCTION

The subjects treated under this Section include capital, employment, salaries and wages, size of establishments and power and fuel used in manufacturing.

Subsection 1. Capital and Repair Expenditures

Prior to 1944 the following information on capital investment was collected: Fixed Capital—Land, buildings, fixtures, machinery, tools and other equipment, Working Capital—(1) Inventory value of raw materials, stocks in process, fuel and miscellaneous supplies on hand; (2) Inventory value of finished products; (3) Cash, bills and accounts receivable, prepaid expenses, etc. This was replaced by the collection of statistics on the expenditure on fixed capital and repairs.

The remarkable increase in capital employed in Canadian manufactures from the beginning of the twentieth century has, of course, run parallel with the rapid growth in industrial operations. From 1900 to 1905 the capital increased from \$446,900,000 to \$833,900,000 and advanced to \$1,958,700,000 in 1915. During this period returns were received from establishments with 5 hands or over, and, while the rise in wholesale prices did not exceed 37 p.c., the capital employed in manufactures increased nearly 340 p.c.

Capital expenditures by manufacturers in 1956 totalled \$487,700,000 for construction and \$906,100,000 for machinery

and equipment, while \$577,800,000 went for repairs. Of the total capital expenditures, amounting to \$1,393,800,000 in 1956, 18.5 p.c. was reported by paper products, 11.7 p.c. by iron and steel products, 10.4 p.c. by chemicals and allied products, 8.6 p.c. by non-metallic mineral products, 8.4 p.c. by non-ferrous metal products, 7.8 p.c. by foods and beverages, 6.7 p.c. by products of petroleum and coal, 4.3 p.c. by transportation equipment, 3.6 p.c. by wood products, etc.

Of the groups reporting capital expenditures of \$50,000,000 or more in 1956 eight reported increases and only one, viz. products of petroleum and coal reported a decrease of \$16,000,000. Of the groups reporting increases, paper products with \$118,700,000 led the list, followed by chemicals and allied products with \$88,600,000, non-metallic mineral products \$72,500,000, iron and steel products \$67,300,000, non-ferrous metal products \$33,500,000, wood products \$7,900,000, transportation equipment \$6,000,000, and foods and beverages \$5,200,000. Rubber products with expenditures of \$13,900,000 was the only other group to report a decline which amounted to \$1,200,000.

Variation in Capital Expenditure 1956 Compared with 1955

Group	1956	1955	Variation
		\$'000,000	
Paper products Iron and steel products Chemicals and allied products Non-metallic mineral products Non-ferrous metal products Poods and beverages Products of petroleum and coal Transportation equipment Wood products	257.4 162.5 144.9 120.0 117.4 109.1 93.0 60.3 50.8	138.7 95.2 56.3 47.5 83.9 103.9 109.0 54.3 42.9	+118-7 + 67-3 + 88-6 + 72-5 + 33-5 + 5-2 - 16-0 + 6-0 + 7-9
All groups	1,393.8	946.3	+447.5

Capital expenditures in 1956 increased by \$447,500,000, the highest on record. This compares with an increase of \$124,200,000 in 1955 and declines of \$146,900,000 in 1954 and \$3,600,000 in 1953. These declines were preceded by an increase of \$180,000,000 in 1952 and \$290,100,000 in 1951. The above table gives the capital expenditures of the major groups in 1956 reporting \$50,000,000 or more, together with the expenditures of these groups in 1955.

Expenditures on capital assets which averaged \$983,000,000 during the past six years reflect the expansion and modernization which the manufacturing industries of Canada have experienced. Although the expansion was at a rapid rate, not all provinces, however, shared in this expansion at an equal rate. Newfoundland had relatively the highest capital expenditures of any province, the percentage of capital expenditures to the value of factory shipments during the period 1950-54

being 11.0 more than double the Canada average. Alberta with 10.7 was in second place and British Columbia with 7.3 was in third place. Ontario and Saskatchewan equalled the Canada average of 4.9, while Prince Edward Island, Nova Scotia, New Brunswick, Quebec and Manitoba were below this figure.

Some changes in the pattern of capital expenditures was evident in 1955 and 1956. All provinces, with the exception of Newfoundland and Prince Edward Island, reported higher expenditures in dollar values. Alberta with 13.1 p.c. displaced Newfoundland from the premier position as regards capital expenditures as a percentage of value of shipments. With the exception of Newfoundland, Prince Edward Island and Saskatchewan, all provinces reported increases in the percentage of capital expenditures in relation to shipments. For Canada as a whole the percentage rose from 4.9 in the 1950-54 period to 5.7 in the 1955-56 period.

Comparison of Capital Expenditures with Value of Factory Shipments, 1950-1956

Subsection 2. Value of Manufacturing Inventory

As explained in the section on Capital Employed, the collection of statistics on capital investment by manufacturers was discontinued in 1944. This was replaced by the collection annually of expenditure statistics on fixed capital, repairs and maintenance from all large manufacturers, with estimates being made for the smaller establishments. As a result of this change no information was available on investment in inventory. Before long, however, the need for this information became apparent. Consequently, beginning with 1949, calendar year-end inventory values were collected separately from all manufacturing plants with an annual gross value of production of \$50,000 or over. These values are inflated to a total by estimating for small firms in each industry on the basis of the gross value-inventory ratio of reporting firms.

Commencing with 1954 questions on inventory were put back on the forms used in the annual survey of manufactures. As a result, all establishments with shipments of \$50,000 or more were required to give this information. As in the case of the calendar year-end series, estimates for establishments with shipments of under \$50,000 were made on the same basis. By comparing the two series for 1954 it was found that they differed slightly. This is mainly due to the difference in time of reporting this information. In the first series the figures refer to the end of December while in the second they refer to the company year which in a number of cases might be anywhere from the end of January to the end of June. The figures in the distribution of the series are accordingly higher by 3.6 p.c. This is due to the desire of most companies to have as low an inventory as pos-

sible at the end of their financial year. When the financial year is other than the calendar year they could and usually do report a higher figure for December than they do for the end of their financial year which is reported in the second series.

It should be noted that the calendar year-end values as shown in the table below are not strictly comparable with those published in previous general reviews on manufacturing, since the series previously published has been reduced by the entire value of inventories held but not owned, i.e. held under progress payments arrangements. The deduction was made from the goods in process component. In previous reviews an item of total inventory holdings was shown separately, but no attempt was made to assign it to any specific component. While the assumption that all such inventory is part of goods in process is not strictly true, it is nevertheless a fairly good working approximation.

Company year-end inventory in 1956 totalled \$3,871,500,000, of which amount \$1,877,000,000 was raw materials and supplies, \$785,800,000 goods in process and \$1,208,700,000 finished goods. The iron and steel group with \$675.0 million reported the highest inventory of any group. Foods and beverages with \$576.2 million came second, followed by transportation equipment with \$302.7 million, paper products \$302.1 million, wood products \$279.7 million, electrical apparatus and supplies \$264.1 million, non-ferrous metal products \$251.2 million, chemicals and allied products \$243.6 million, etc.

¹ The opening inventory for 1956 differs from the closing inventory of 1955 because of the receipt of revised data, the inclusion of new firms and the removal of figures for firms that did not operate during 1956.
² Revised.

³ Less than \$50.000.

Subsection 3. Employment in Manufacturing Industries

Monthly Record of Employment.—Ordinarily, manutacturing employment in Canada reaches its highest point during the summer months. Some of the seasonal industries, such as canning, are most active then, textile industries are preparing winter goods, and industry generally feels the active demand of the agricultural purchasing power resulting from the prospect of the season's harvest.

After the setback of 1929, employment in 1930, 1931, 1932 and the first half of 1933 declined steadily, the monthly employment figures in each case being lower than the corresponding month of the previous year. The peak of employment in June. 1929, when 575,693 production workers were on the payrolls, was surpassed in September, 1937, with 582,305 production workers. After the outbreak of war the improvement in employment became increasingly rapid. A record high was reached in August, 1943, when 1,067,890 production workers were employed, an increase of 96.4 p.c. over the same month in 1939. The highest employment during 1944 occurred in June when 1,049,557 production workers were employed. From then on employment declined steadily to the end of 1945 when 819,619 production workers were reported. At the end of 1951 there were 953,952 production workers employed, compared with an employment of 961,820 production workers in December, 1944, and 1,021,630 in December, 1943.

During the first half of 1952 the number of production workers increased each month, but not to the extent of the employment in the same month of the previous year. From the middle of the year monthly employment figures exceeded those of the previous year. This trend continued to October 1953. The trend for the next two months was downward so that by the end of 1953 there were only 990,611 production workers as compared with 1,018,764 at the end of December 1952.

The minor recession experienced in 1954 is reflected in the monthly employment figures, the number employed each month being lower than the corresponding month of the previous year, although there was the usual upturn during the summer months. Employment at the end of December at 932,786 was at the lowest level since 1949 when 906,851 persons were employed. December 1952 with 1,018,764 production workers had the highest year-end figures during this period.

The downward trend of 1954 continued until the end of April 1955. From then on, the monthly employment figures were consistently higher than the corresponding months of the previous year, so that by the end of December 1956 production workers totalled 1,025,860 as compared with 993,215 the year before and 932,786 at the end of December 1954.

Subsection 4. Hours Worked in Manufacturing Industries

Hours Worked by Production Workers .- From 1932, the first year for which figures on hours worked per week by production workers are available, to 1945, each firm was required to report the number of hours worked by all its production workers during the month in which the greatest number had been employed, the only exception being the years 1938 and 1939 when one week in a month of normal employment was reported. In 1938 the number of hours worked per week were compiled by sex, and a change was also made in the analysis of the weekly hours worked. Since 1940 the hours worked per week include overtime while prior to that overtime was excluded. These changes make it impossible to measure accurately the changes in the number of hours worked per week. In any case, the figures in Table 29 do not refer to any particular month, since the month of highest employment might be May for one firm and October for another: they represent the summation of the different months of highest employment as reported by all firms. For a given industry, however, the month of highest employment is more significant as in this case it coincides for a great number of firms engaged in the same industry.

For all production workers, the hours worked per week declined from 48.9 in 1932 to 47.2 in 1939, and reached 50.6 in 1941, some of the increase no doubt being due to the inclusion of overtime. Since then there was a counter movement in the hours worked, especially among females, due to the employment of many workers on a part-time basis. Whereas in 1939 there were only 2.8 p.c. of male and 5.3 p.c. of female production workers working under 30 hours per week, in 1944 these percentages rose to 5.3 and 12.5 respectively. Since the end of the war the normal working week has been dropping steadily. In 1945 average hours per week for male production workers totalled 47.6 and for females 42.7.

The method of collecting statistics on hours worked was changed in 1946. Instead of collecting this information for one week in the month of highest employment which varied

from plant to plant, the last week of November was chosen for the base period. For 1948 and subsequent years the period was changed to the last week in October. The question on hours worked was taken out of the annual schedules used in connection with the census of manufactures and this information is now collected by the Employment Statistics Section. Establishments employing 15 hands or over only are covered. The statistics for 1946 to 1956 are, therefore, not exactly comparable with those for earlier years which include all establishments, both large and small.

On the above basis, the hours worked per week declined for all workers engaged in manufacturing. The hours of male production workers dropped from 44.9 in 1946 to 42.5 in 1956, female production workers from 40.0 to 39.2, male office employees from 42.0 to 39.4 and female office employees from 39.5 to 37.9.

Persons employed in 1950 and 1953 were classified on the basis of earnings per week instead of hours worked. For this reason the distribution of employees by hours worked per week is not available for these years. It is the intention in future to classify employees one year on the basis of hours worked, the second year on the basis of weekly earnings, while in the third year no break-down of either the hours worked or weekly earnings will be collected. Instead a more detailed break-down of salaried employees into (a) managerial and professional and (b) office workers will be requested.

Administrative and office employees as a rule work shorter hours than production workers as the following figures for 1956 indicate.

	Production Workers	Supervisory and Office Employees
Both sexes	41.8	38.9
Male	42.5	39.4
Female	39,2	37.9

TABLE 29. Production Workers in Manufacturing, Working Specified Numbers of Hours per Week in the Month of Highest Employment, 1938-451

Note: Hours worked per week in 1934-37 are given at p. 393 of the 1942 edition of the Canada Year Book; in 1940 and 1941 at p. 392 of the 1943-44 edition.

¹ Classified statistics on hours worked since 1946 are taken from the annual report "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division of the Bureau. These statistics which are collected every third year cover establishments employing 15 hands or over only.

² Last week in November.

TABLE 31. Average Hours Worked per Week in the Manufacturing Industries of Canada, by Provinces, 1946-561 (Hours worked by wage-earners from 1938 to 1945 are given on page 53 of the 1950 General Review of the Manufacturing Industries of Canada)

¹ Statistics on hours worked since 1946 are taken from the annual report" Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division of the Bureau. These statistics cover establishments employing 15 hands or over only. For 1946 and 1947 they refer to the last week in November and for 1948 to 1956 to the last week in October.

¹ Statistics on hours worked since 1946 are taken from the annual report "Earnings and Hours of Work in Manufacturing, compiled by the Employment Section of the Labour Division of the Bureau. These statistics cover establishments employing 15 hands or over only. For 1946 and 1947 they refer to the last week in November and for 1948 to 1956 to the last week in October.

Subsection 5. Earnings in Manufacturing Industries

In 1955, the 37,428 establishments covered, employed 301,297 administrative and office employees and 1,051,723 production workers, a total of 1,353,020 persons. Out every 1,000 persons employed in manufacturing, 223 were classed as office employees and 777 as production workers; the former earned 28 p.c. and the latter 72 p.c. of the total amount paid out as remuneration for services.

A notable feature during the past few years was the reduction in the disparity between average annual earnings of office and production workers. Whereas in 1939 average annual earnings of production workers were only 56 p.c. of that paid to office workers, in 1943 the percentage rose to 76, they declined to 69 in 1947 and rose to 74 in 1956. This tendency towards equalization was due, in part, to the controls adopted

by the Government during the war years which tended to stabilize earnings of office workers more so than the earnings of production workers. The increase in average earnings of production workers was also incluenced by the fact that large numbers were employed in the highly paid iron and steel industries and by the increase in the number of hours worked, some at overtime pay.

Ontario has a larger proportion of females among its office employees than the other provinces. The same situation prevails in Quebec with regard to production workers, due, no doubt, to the textile industries of the Province. The importance of the textile industries in providing employment to females is strikingly illustrated by the fact that of all female production workers engaged in the manufacturing industries of Canada in 1956, 41 p.c. were found in the textile and clothing groups.

Average earnings of office workers in 1956 amounted to \$4,222 which was \$1,386 or 49 p.c. higher than in 1949. Office

employees in Ontario with \$4,413 were the highest paid. Those in British Columbia were second with \$4,265, Quebec third with \$4,141 and Manitoba fourth with \$3,797. The fact that head offices of many large corporations are located in Montreal, Toronto, Winnipeg and Vancouver tends to raise the average salary of the provinces in which these cities are located.

Average earnings of production workers in 1955 amounted to \$3,136 which was \$1,069 or 52 p.c. higher than in 1949. The manufacturing industries of British Columbia paid the highest average annual wages of \$3,472. Ontario with \$3,349 was in second place, followed by Alberta with \$3,137, Saskatchewan \$3,114, Manitoba \$2,937, Newfoundland \$2,861, Quebec \$2,858, etc. The high figure shown for Yukon and Northwest Territories in regard to average earnings of production workers is due to the unusual conditions under which industry is carried on in these regions, and is not representative. Statistics of the distribution of employees by provinces and industrial groups as well as average annual earnings are given in Table 33.

¹ The averages of the number of production workers and earnings for the years 1931 to 1956 are strictly comparable with those for the years up to 1925 but not with those for the intervening years. The figures for the latest years—as for the earliest—represent the earnings for complete manyears of work, with no allowance for periods of unemployment. The difference amounts only to about 3 or 4 p.c. in the total figures and affects chiefly the seasonal industries.

The increase in the number of office employees in 1931 is due to the following changes in method: 1. Prior to 1931 working proprietors, such as bakers, sawmill operators, small clothing manufacturers, etc., were required to report themselves as production workers. In 1931 and subsequent years, however, all such proprietors reported themselves as office employees. In 1931 travelling salesmen who were attached to the plant, and devoted all or the greater part of their time to selling the products of that plant, were included with office employees. Prior to this they were not reported at all.

Average Annual Earnings in the Forty Leading Industries—Variations in average earnings are related to the number of employees in industries or areas where pay levels are above or below the average because of differences in basic pay rates, in sex and occupational distributions, in amounts of bonus or commission payments, levels of activity, etc. The earnings of salaried men are substantially higher, on the average, than those of other categories, mainly because their numbers include relatively highly-paid managerial and professional workers. Women's earnings are generally well below those of men in the same industry, chiefly as a result of pay differentials, occupational differences, the greater incidence of part-time work and absenteeism among women, and their higher proportions of younger and less experienced workers.

In 1956 there were eight industries paying office workers \$5,000 or over, as compared with none in 1951. Indicative of the rapidly changing pattern of remuneration in manufacturing is the fact that in 1945, the last year of the war, no industry paid office workers annual salaries of over \$3,000. The highest average earnings in the year were \$2,935 reported by the brewing industry. Highest average earnings in 1956, amounting to \$5,896 were received by the administrative and office employees of the pulp and paper industry which has held the premier position for a number of years. Breweries with \$5,571,

primary iron and steel \$5,372, petroleum products \$5,339, acids, alkalies and saits \$5,178, motor vehicles \$5,119, veneer and plywood \$5,111 and bridge and structural steel \$5,005 were the other industries with \$5,000 and over. There were nine other industries with average salaries of \$4,500 to \$5,000, fourteen with salaries of \$4,000 to \$4,500, six with salaries of \$3,000 to \$4,000 and the remaining three averaged below \$3,000. Bread and other bakery products with \$2,967, butter and cheese with \$2,929 and sawmills with \$2,426 were the three industries in this category. Average salaries in the forty leading industries totalled \$4,309 as compared with \$4,032 for the smaller industries. This lower average is due in part to a higher proportion of female office employees in the smaller industries. In the forty leading industries 26 p.c. of the office employees were female while in the smaller industries 33 p.c. were in this category.

The increase in the average earnings of production workers since 1945 paralleled that of adulhistrative and office workers. Whereas in 1945 there were only four industries averaging over \$2,000, in 1956 none of the forty leading industries averaged below this figure. In 1945 the highest annual earnings, amounting to \$2,365, were paid by the motor vehicle industry, while in 1956 the highest earnings which totalled \$4,383 were paid by the primary iron and steel industry which displaced the

petroleum products industry that has been in first place for a number of years. The highest earnings are usually paid by industries in which the proportion of skilled workers is high, and the proportion of female workers is low. Seven industries in 1956 had average annual earnings of \$4,000 or more. These were: primary iron and steel \$4,333, petroleum products \$4,377, pulp and paper \$4,236, acids, alkalies and salts \$4,140, nonferrous metal smelting and refining \$4,096, bridge and structural steel work \$4,034 and motor vehicles \$4,022. In ten other industries average annual earnings ranged between \$3,500 and \$4,000, in nine they were between \$3,000 and \$3,500, in nine other they were between \$2,500 and \$3,000 while in the remaining five they were below \$2,500. This last group includes

industries made up of a large number of small establishments and in which the proportion of female workers is high. Cotton yarn and cloth with \$2,476, women's factory clothing \$2,136, men's factory clothing \$2,082, leather footwear \$2,077 and fruit and vegetable preparations \$2,052 are the industries included in this category. Average annual earnings of production workers in the forty leading industries amounted to \$3,301 as compared with \$2,757 for the smaller industries. The lower average for the smaller industries is due mainly to a higher proportion of female workers. Employment by sex, and average annual earnings in the forty leading industries are given in Table 34.

TABLE 34. Annual Earnings in the Forty Leading Industries, 1956

Average Annual, Weekly and Hourly Earnings. - Statistics on employment and earnings are compiled in two separate divisions of the Bureau, viz. the Industry and Merchandising Division and the Labour Division, The Industry and Merchandising Division collects from every manufacturer once a year details of the number of persons employed and total payments made during the calendar year, classified by sex. This data is also classified into (a) administrative and office employees and (b) production and related workers. The office employees reported is the average for the year, while in the case of production workers manufacturers report the number of workers receiving pay during the last pay period of each month and the monthly average is calculated in the Bureau. We thus have statistics on employment broken down by sex with separate figures on the amounts paid to (a) administrative and office employees referred to as Office Employees and (b) production and related workers referred to as Production Workers. Average annual earnings, not broken down by sex, are, therefore, available for these two classes of employees.

Statistics on weekly and hourly earnings as well as hours worked per week are compiled by the Employment Section of the Labour Division. In addition to the monthly surveys on employment, payrolls and man-hours which covers all sectors of the economy, there is an annual survey on earnings and hours worked in the last week of October, covering the larger manufacturing establishments. Each year statistics of earnings and hours of male and female wage-earners and salaried employees are obtained, with additional detail collected in a three-year cycle since 1949. In 1956, as in 1953 and 1950, a distribution of wage-earners and salaried employees by amounts earned in the survey week was made. The first two inquiries had required distributions in \$5 intervals to \$60 per week, in \$10 intervals thereafter, with an upper class of \$100 and over while the 1956 survey called for distributions in \$10 intervals to \$150 a week. In 1955, a distribution of wage-earners in a given range of hours was obtained while, in 1954, information for office and clerical workers was segregated from that for managerial, professional and other salaried personnel. The annual and monthly surveys cover establishments usually employing 15 or more persons and include almost 90 p.c. of all employees in manufacturing as reported to the Annual Census of Manufactures.

Establishments co-operating in the annual surveys are asked to furnish material for all full-time, casual and part-time employees receiving pay in the last week in October, except home-workers. Proprietors, firm members, pensioners, and staffs of separately-organized sales offices are excluded. Establishments closed in the week because of labour disputes usually report for the nearest week of operation. Men and women are grouped as (1) wage-earners, defined generally as production workers, including working foremen, route-drivers, shipping and maintenance staffs, and related employees, and (2) salaried employees, comprising general office and clerical workers in the office and plant, executive, administrative and professional personnel, and travelling salesmen directly responsible to the plant administration. Hours and earnings in the week are required for workers of both sexes in each category.

The reported hours include full-time, short-time and overtime hours worked and any hours of paid absence in the week. The earnings cover the gross payrolls before deductions for taxes, unemployment insurance contributions, etc., including time, piece-work and commission earnings, regularly-paid incentive, cost-of-living and other bonuses, overtime earnings, and payments to persons absent with pay during the survey week.

While establishments differ to some extent in their classification of certain categories of employees, the proportions of salaried employees in the various industries and areas are generally related to the type and scale of operations. Where plants are typically small, as in Saskatchewan, proprietors and firm members (excluded from the surveys) frequently undertake managerial and office duties that in larger establishments require substantial staffs. On the other hand, large and multiple plant organizations and those requiring many professional workers, such as printing and publishing, employ above-average proportions of salaried personnel. Where travelling salesmen and associated office workers appear on the plant payrolt, salaried workers are relatively more numerous than where separate sales offices are maintained. The proportions of em-

ployees reported as salaried staff and as wage-earners are affected by seasonal and market conditions and by other factors contributing to variations in production levels, which usually cause sharper fluctuations in numbers of wage-earners than of salaried employees.

Inter-industry and area variations in hours, as well as year-to-year changes, result from a variety of causes. These include (1) the length of the standard work week, (2) the number of casual and part-time workers and the hours they worked in the reported week, (3) amounts of overtime worked, and of time lost through absenteeism, labour turnover, industrial disputes, lay-offs, etc., (4) differing occupational requirements, and (5) varying proportions of men and women. Women generally average substantially less time than men. Their standard work week tends to be shorter, relatively small proportions of women are employed in industries where the work week is above-average, and they have a higher incidence of part-time work and of absenteeism.

Differences in average earnings are related to the distributions of employees in industries or areas where pay levels vary from the average because of variations in basic pay rates, in sex and occupational distributions, in amounts of bonus or commission payments, in levels of activity, etc. The earnings of salaried men are substantially higher, on the average, than those of other categories, mainly because their numbers include relatively highly-paid managerial and professional workers. Women's earnings are generally well below those of men in the same industries, chiefly as a result of pay differentials, occupational differences, the greater incidence of part-time work and absenteeism among women, and their higher proportions of younger and less experienced workers.

There are a few minor differences in the coverage and wording used by the two divisions. The terms "administrative and office employees" and "production and related workers" used by the Industry and Merchandising Division in its annual survey of manufactures corresponds more or less to the terms "salaried employees" and "wage-earners" used by the Employment Section of the Labour Division. There are, however, two minor differences in the two surveys. The Industry and Merchandising Division includes working proprietors with office employees while the Labour Division excludes them from their surveys. In the case of travelling salesmen attached to the plant the Labour Division includes them with salaried employees while the Industry and Merchandising Division does not consider them as being employed in manufacturing.

Prior to 1946 statistics on weekly and hourly earnings as well as hours worked by production workers were collected by the industry and Merchandising Division in the annual survey of manufactures. Since then this phase of the work was taken over by the Employment Section of the Labour Division and was also expanded to include office employees.

The figures for the years 1934 to 1945 given in Table 35 are based on an analysis of a pay-list covering one week in the month of highest employment. For this reason the figures do not refer to any particular month, since the month of highest employment might be May for one firm and October for another; they represent the summation of the different months of highest employment as reported by all the firms. For a particular industry, however, the month of highest employment is more significant as in such a case it coincides for a great number of firms engaged in the same industry. The figures since 1946 are based on returns received from establishments employing 15 hands or over, and for 1946 and 1947 they refer to the last week in the month of October.

As mentioned above, average annual earnings in manufacturing, classified by sex, are not directly available. To calculate annual earnings by sex, the weekly earnings compiled by the Employment Section are correlated with the employment and payroll data obtained by the annual survey of manufactures. The following example will illustrate the method that is used.

In 1949 the paper products group, according to the annual census of industry, reported 9,077 male and 3,573 female office employees with total payments of \$46,537,336. From the October survey on weekly earnings this group showed

\$77.41 per week for male and \$34.88 per week for female office employees. The proportion of female to male earnings is therefore .451 $\left[\frac{$34.88}{$77.41}\right]$ Female employees are first reduced

to a male basis and the calculation is then as follows:

Annual Earnings of Male Employees

$$\frac{\$46,537,336}{9,077 + .451 (3,573)} = \frac{\$43,537,336}{10,688} = \$4,354$$

Annual Earnings of Female Employees

In the foregoing calculation the assumption is made that annual earnings of male and female employees vary in the same proportion as their weekly earnings. In the above illustration it may also be noted that the calculated annual earnings for male employees amounting to \$4,354 are higher than the weekly earnings multiplied by 52 which total only \$4,025 (\$77.41x52). This difference is due to the fact that the earnings reported to the Census of Manufactures include payments to executives as well as bonuses to employees which are usually paid at the end of the year, while the earnings reported for the one week in the year exclude such payments.

Average Annual, Weekly and Hourly Earnings of Production Workers.— Average weekly earnings of male production workers for manufacturing as a whole amounted to \$70.67 in 1956, an

increase of \$23.34 or 49 p.c. as compared with 1949. Average hourly earnings advanced from \$1.07 in 1949 to \$1.66 in 1956, an increase of 55 p.c., while annual earnings at \$3,458 were 51 p.c. higher. There are wide regional and industrial variations in hourly earnings. British Columbia is the highest paying province, hourly earnings for male production workers being \$1.90 in 1956 as compared with \$1.66 for Canada as a whole. Ontario with \$1.75 was second while Prince Edward Island with \$1.05 was the lowest. On an industrial basis, male workers in products of petroleum and coal industries were the highest paid with an hourly average of \$2.07, while the leather group was the lowest with \$1.24.

Female production workers received on an average \$39.29 per week in 1956, an increase of \$12.11 or 45 p.c. since 1949. Hourly earnings at \$1.00 were 47 p.c. higher, while annual earnings at \$1,923 were 46 p.c. higher. In the case of females British Columbia with \$1.20 per hour was also the highest paying province, while Newfoundland with 57 cents was the lowest. The transportation equipment and tobacco groups with \$1.37 per hour paid the highest wages to its female production workers, and the leather products group the lowest with 85 cents per hour. The leather products group had the lowest hourly earnings for both male and female production workers.

The following table gives the weekly and hourly earnings of male and female production workers for each province and major industrial group for the year 1956.

Average Weekly and Hourly Earnings of Male and Female Production Workers, by Provinces and Industrial Groups, 1956

¹ Statistics on weekly and hourly earnings are taken from the annual report "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division of the Bureau. These statistics cover establishments employing 15 hands or over. For 1946 and 1947 they refer to the last week in November and for 1948 to 1956 to the last week to Cotober. Annual earnings are calculated. See text on page 76.

² Estimated on the basis of hours worked by female workers in 1938 and 1939 as compared with those worked by male workers in these years.

3 Not available.

TABLE 36. Average Annual, Weekly and Hourly Earnings of Production Workers in the Manufacturing Industries, by Provinces, 1946-56

(Statistics for the years 1938-45 are published on page 60 of the 1950 General Review of the Manufacturing Industries of Canada)

^{*} Dash indicates that the information is not available.

* The average annual earnings are calculated on the basis of the total amount paid during the year as reported to census of industry, while the weekly earnings are based on an analysis of the pay-list for the last week in October and only cover establishments employing 15 hands or over. The drop in the average annual earnings is due in part to these factors as well as to the fact that in 1951 statistics for the processing of fish in Newfoundland were included with manufactures for the first time. As this is a seasonal industry annual earnings are, therefore, lower. In 1951 average annual earnings of production workers for both sexes for this industry averaged \$1,151 as compared with \$2,806 for the other industries of the province. province.

Average Annual, Weekly and Hourly Earnings of Administrative and Office Employees.— Annual earnings of male office employees in 1956 averaged \$4,918, weekly earnings \$99.05 and hourly earnings \$2.51. For female office employees annual earnings averaged \$2,449, weekly earnings \$49.31 and hourly earnings \$1.30. Average annual earnings of all office employees totalled \$4,222 in 1956, an increase of 86 p.c. since 1946. Weekly earnings at \$85.23 were 94 p.c. higher and hourly earn-

ings at \$2.19 were 105 p.c. higher. There were seven groups with average weekly salaries for male office employees of \$100.00 or more. Petroleum products with \$126.42 pet week paid the highest salaries. Paper products with \$117.86 came second, followed by non-ferrous metal products with \$104.06, transportation equipment \$103.42, electrical apparatus and supplies \$102.73, chemicals and allied products \$101.85 and tobacco products \$101.57. The leather products group paid the

lowest salaries of \$81.65. In the case of female office employees there were seven groups with average salaries of \$50.00 or more. Female employees in the petroleum and coal group received the highest weekly salary of \$57.72, followed by tobacco and tobacco products with \$56.19, transportation equipment \$53.81, paper products \$53.03, chemicals and allied

products \$52.51, non-ferrous metal products \$50.89 and electrical apparatus and supplies \$50.74. In this case too, the leather products group had the lowest weekly salary of \$42.06.

The following table gives the weekly and hourly earnings of male and female office workers for each province and major industrial group for the year 1956.

Average Weekly and Hourly Earnings of Male and Female Administrative and Office Employees by Provinces and Industrial Groups, 1956

¹ Statistics on weekly and hourly earnings are taken from the annual report "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division of the Bureau. These statistics cover establishments employing 15 hands or over. For 1946 and 1947 they refer to the last week in November and for 1948 to 1956 to the last week in October. Annual earnings are calculated. See text on page 76.

Office Workers and Other Salaries Employees.—A survey of weekly earnings of administrative and office employees, classified into (a) managerial and professional employees and (b) office workers, was undertaken for the first time in 1951 and repeated again in 1954. It is the intention to repeat this survey every third year in the future. According to Table 41 below average weekly salaries of all office and supervisory employees in 1954 averaged \$77.81. Male employees received \$90.99 and female employees \$45.00. The increase per week since 1951 for all employees totalled \$11.83, for males \$13.44 and for females \$6.58.

The average weekly salaries of office workers rose in the three years from \$51.14 to \$59.29, an advance of 15.9 p.c. as compared with 17.9 p.c. for all salaried employees. The average for men classed in the office group increased by \$10.26 to \$70.94, and for women by \$6.39 to \$44.16, representing an advance of 16.9 p.c. in each case. The upward movement was more pronounced in the durable goods division than in nondurables. Higher earnings for office workers were reported in 1954 in all provinces and industry groups, except tobacco and tobacco products, where the men's average salary, at \$68.31 was \$1.87 below the 1951 figure. The drop was caused mainly

by the transfer of a group of employees to a separately organized sales office since 1951 when they were paid well above the general level.

The residual group of salaried employees, composed mainly of managerial, professional and related staffs and professional salesmen, comprises a varied group, the composition of which may differ from firm to firm. Its components are affected not only by varying requirements for administrative and professional personnel but also by the extent to which proprietors

and firm members (excluded from the survey) undertake such duties, and by the organization of separate sales offices. The managerial and professional employees reported in 1951 averaged \$98.38 for the week; the men earned \$99.73 and the women \$57.04. Three years later, the averages were \$109.67 for both sexes, \$111.14 for men and \$64.89 for women. All industry groups and provinces reported higher earnings in 1954, raising the average salaries of the men to more than \$100 a week in most of the major industries in Canada,

Taken from the annual reports "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division erm "Administrative and Office Employees" as used by the annual survey of manufactures corresponds to the term "Salaried Employees" used by the Employment Section of the Labour Division.

⁻⁻ Number to small to be significant.
- Nil.

Distribution of Employees on the Basis of Weekly Earnings.— Prior to 1950 statistics on the distribution of employees on the basis of weekly earnings were compiled by the Industry and Merchandising Division in the annual census of manufactures. At first only wage-earners were covered and in 1944 salaried employees were also included. In 1946 this phase of manufacturing statistics was transferred to the Employment Section of the Labour Division. The 1950 survey which covered the last pay period in October made available data on the distribution of employees by earnings groups for the first time since the Census of Manufactures survey in January 1944. The data in the two surveys are not strictly comparable, largely because the earlier surveys included establishments employing less than 15 persons and were conducted for a different period of the year. Also the 1944 survey reflected wartime conditions.

Variation in the provincial distribution of employees by amounts earned are obviously related to pay levels, occupational and sex differences, number of casual and part-time workers, and length of the working week in the more important industries in each area. Most of the employees in the lowearnings ranges are casually-employed workers, or those who do not work full time in the week. Part-time work is particularly common among women; the 1952 survey showed that 11.9 p.c. of the female production workers reported in manufacturing worked 30 hours or less, as compared with 4.6 p.c. for men.

Short-time or casual work is characteristic of such industries as fish processing and fruit and vegetable canning, the duration of employment depending on the immediate availability of materials.

The tremendous change in the level of incomes of factory workers since the war is strikingly illustrated in Table 42. Whereas in 1940 only 3 p.c. of male and none of the female production workers received \$50 or more per week, in 1956 these percentages jumped to 85 and 24 respectively. The percentage of employees in the lower income groups declined accordingly. Whereas in 1940, 72 p.c. of male production workers received less than \$30 per week, in 1956 the percentage declined to 3. For female production workers the percentage in these groups declined from 99 to 28.

For office workers information on the distribution by income groups is only available for 1944, 1950, 1953 and 1956. Earnings by office workers, too, advanced to unprecedented heights. The percentage of male office workers receiving \$50 or more per week rose to 92 in 1956 from 39 in 1944, while for females the percentage in 1956 was 46 as compared with none in 1944. Tables 43 and 44 give the distribution by income groups of male and female production workers as well as office workers by provinces and major industrial groups for 1956.

Real Earnings of Employees in Recent Years.—When the index number representing the average yearly earnings of production workers is divided by the consumer price index, on the same base, a measure of "real" income is obtained. Index numbers for 1931 to 1956 are given in Table 45. In 1933,

the height of the depression, real earnings were 63.9 on the 1949 base. From then on they rose steadily and stood at 101.5 in 1944, an increase of about 59 p.c. In 1946 real earnings dropped to 94.6 and from then on continued to rise each year. In 1956 the index stood at 128.5.

Percentages of Salaries and Wages to Net Value of Products.— Table 46 shows the relation between salaries and wages paid by manufacturers and the total net value of production. Figures of gross production are often used in such calculations, but the values out of which the wages of employees must come in the long run are the values added to the raw materials while they are in the factory. Such added values constitute the real production of the manufacturing plant and are alone available for payment of salaries and wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met. The percentage of salaries declined steadily with the increasing manufacturing production from 1924 to 1929, while from 1931 to

1935 and again in 1939 and 1954, due to decreased industrial activity, the percentage of salaries to value added was above normal. It should be borne in mind, however, that salaried employees increased 364 p.c. during the period 1917-56 while wage-earners increased 94 p.c. The percentage of wages has fluctuated much less than that of salaries. The number of wage-earning employees may be more rapidly adjusted to the activity of the industry and wage levels likewise may be more readily adjusted to the price levels of the products. Of the increase in the net value of production since 1939 amounting to \$8,074,372,678, \$3,832,881,037 or 47.5 p.c. was passed along in increased salaries and wages.

¹ Equivalent to "net value of products". see footnote 1 , Table 1.

Subsection 6. Size of Manufacturing Establishments

The size of the manufacturing establishment is generally measured either by the value of product or by the number of employees, but each of these methods has its limitations. The latter takes no account of the differences in capital equipment at different times or in various industries and obviously the increased use of machinery, as in the flour-milling industry, may lead to an increase in production concurrently with a decrease in number of employees. The former measure has to be adjusted for changes in the price level and, as between industries, it makes those in which the cost of raw materials is relatively high appear to operate on a larger scale.

Size as Measured by Gross Value of Products.— While in 1922 the 420 establishments each producing over \$1,000,000 had an aggregate value of products of \$1,268,056,129 or 51 p.c. of the total production of all manufacturing industries, the 719 establishments producing over \$1,000,000 each in 1929

had an aggregate value of products of \$2,516,064,954, or 62 p.c. of the grand total for all manufacturing establishments -a very significant change in the short period of eight years. In 1931, however, the number of plants with a production of over \$1,000,000 dropped again to 482, their output being valued at \$1,451,658,954, or 53 p.c. of the total. With the increased production resulting from war needs, the number of plants wit a production of \$1,000,000 or over jumped to 1,376 in 194 and their output was about 75 p.c. of the total value of man factures. With the end of the war and the consequent decliin production of the huge war plants the number of establis ments with a production of \$1,000,000 or over, although j creasing to 1,442 in 1946, nevertheless saw a decline in t proportion of their output to 67 p.c. of the total. With increas prices and an expansion in the physical volume of producti 1947 to 1956, establishments with a production \$1,000,000 or over increased to 2,979 while their contribut to the total output rose to 81 p.c.

¹ Under this heading are included only those head offices which are not located at the plant.

Size as Measured by Number of Employees.— In 1929, establishments employing 501 hands or over accounted for 27.3 p.c. of the number of employees engaged in manufacturing The tendency then in evidence of increasing concentration into larger units was checked by the depression, the percentage dropping to 20.5 in 1933, (central electric stations included), but rising again to 25.6 in 1939. The same holds true for establishments employing 101 hands or over. In 1929 they employed 61.9 p.c., in 1933, 55.7 p.c. and in 1939, 61.5 p.c.

The effect of the War on the concentration of industries into large units is illustrated by the increase in the number of establishments employing 500 hands or over. In 1939 such establishments numbered 172 and employed 25.6 p.c. of the total number of employees engaged in manufacturing. By 1944 the number had increased to 383 and the percentage of total employees to 47.0. In a further subdivision of this group in 1944 it was found that 226 establishments employed between 500 and 999 persons, 56 between 1,000 and 1,499, and 101 employed over 1,500. Altogether there were 12 plants employing over 7,000 persons, the largest having an employment of a little over 13,000 with the next three largest employing between

9,000 and 10,000. Three other plants employed between 8,000 and 9,000 persons, while the lowest five plants in this group employed between 7,000 and 8.000 workers.

With the resumption of peace-time production the larger establishments declined in size so that by 1956 only 66 establishments employed over 1,500 persons, as compared with 101 in 1944. In 1956 there were only three manufacturing plants employing between 9,000 to 10,000 persons. Three other establishments employed between 8,000 and 9,000 and four employed between 6,000 and 8,000. Altogether there were only twelve establishments employing over 5,000 persons in 1956.

TABLE 52. Principal Statistics of Manufacturing Industries, by Industrial Group, Classified by Number of Employees per Establishment 1956 - Concluded

Industrial group, by size	Estab- lish- ments	Employees	Salaries and wages	Cost of fuel and electricity	Cost at plant of materials used	Selling value of factory shipments
	nui	mber	dollars			
Miscellaneous manufacturing industries: Under 5 employees	638 458 309 84 46 16 4	1,288 3,825 8,099 5,725 5,997 4,692 3,615	3, 351, 652 10, 796, 969 22, 724, 834 15, 191, 452 18, 037, 530 15, 202, 076 14, 259, 537 784, 430	273, 181 670, 222 1, 025, 542 587, 686 737, 748 478, 066 337, 099	4,365,177 12,713,571 40,325,963 28,057,808 25,011,731 17,512,781 10,882,691	10,178,594 31,341,487 83,329,176 57,710,842 59,746,391 42,469,163 41,804,360
Totals	1,556	33,432	100, 348, 480	4, 109, 544	138, 869, 722	326, 580, 013

¹ Under this heading are included only those head offices that are not located at the plant. ² Consists of the industry "Publishing (only) of Periodicals".

Size of Establishment in Leading Industries. - Table 53 summarizes the degree of concentration in some of the leading industries of Canada. Concentration is extremely marked in the case of motor vehicles, non-ferrous metal smelting and refining, railway rolling-stock, cotton yarn and cloth, primary iron and steel, pulp and paper, and heavy electrical machinery; whereas in the case of women's factory clothing, miscellaneous food preparations, furniture, butter and cheese, bread and other bakery products, fruit and vegetable preparations, sawmills and men's factory clothing, the degree of concentration is low. This concentration is analysed in detail for each of the twentyfive leading industries in the tables following.

TABLE 53. Percentage Importance of Establishments, each Employing 200 or more Persons in the Twenty-Five Leading Industries, 1956.

Pulp and paper 80 63.5 95.1	No	Industry .	Number of such establishments	Percentage of total number in the industry	Percentage of of total shipments in the industry

Subsection 7. Fuel and Power Consumption

Cost of fuel and Electricity. - Fuel is used quite generally throughout the industrial field for the generation of power by means of steam and internal combustion engines. It is also used for the heating of plants, and for providing the heat necessary to some manufacturing processes. The most important industries where heat is applied to the materials to facilitate or accomplish the desired transformation are foundries and machine shops, brick, tile, lime, and cement-making, petroleum refining, the glass industry, distilleries, food preparation. rubber goods, etc. Fuel used for such heating purposes, as well as for power, is included in the figures of Table 55. In addition to the electricity used for ordinary power purposes, the figures include also the electricity used for heating boilers in the pulp and paper industry. Consumption of surplus energy in electric boilers increased rapidly during the years preceding the Second World War.

The figures of the table do not include coke charged to iron-blast furnaces or foundry cupolas. Neither do they include fuels that constitute the raw materials to be transformed, as coal in the coke and gas industries and crude petroleum in the refining industry.

The value of purchased fuel consumed increased 484 p.c. from 1939 to 1956. Part of the increase was due to an increase in the quantity used and part to the rise in the unit cost of fuels of all kinds. The cost of electricity purchased, on the other hand, has increased during the same period by 277 p.c. The groups of industries in which fuel was most extensively used in 1956 were: paper products, products of petroleum and coal, foods and beverages, iron and steel products, non-metallic mineral products, non-ferrous metal products and chemicals and allied products.

Of the total cost of purchased fuel and electricity for Canada as a whole in 1956, 63.6 p.c. was for fuel and 36.4 for electricity. Percentage wise, Nova Scotia with 77.0 p.c. of the Provincial total was the largest user of fuel, while Quebec with 55.4 p.c. was the smallest. Provinces lacking in water power resources naturally have to rely on fuel for power, and for this reason the percentage that fuel is to the total is much higher than in Provinces such as Quebec where there is an abundant supply of water for power purposes. In the Provinces of Prince Edward Island, Nova Scotia, New Brunswick, Saskatchewan, and Alberta, primary power produced from fuels is an important factor in power utilization.

Power Consumption. — Power equipment installed in manufacturing establishments is a very good barometer of the industrial development of Canada, inasmuch as production is increasingly dependent on power equipment. Increases and decreases in productive capacity, measured in horse-power, are not the result of temporary fluctuations in cost and values in the same manner as capital investments, values of products,

etc. Of course, power equipment installed is not a measure of the actual utilization of power for there is generally an excess over actual requirements, i.e., over power equipment in operation. Producers must have an installed operating margin in excess of normal requirements to provide for booming business conditions or breakdown of part of the plant. In times of depression this margin increases. During short periods of expanded production, the number of horse-power per wage-earner tends to decrease in view of the fact power equipment is not immediately increased, the expanded production being secured through overtime work or an increase in the number of shifts worked.

Of the total increase in power equipment employed in manufacturing industries between 1939 and 1953, 75 p.c. was in electric motors operated by power purchased from central electric stations. However, some sections of Canada are not well provided with water power and in such sections primary power derived from steam engines or turbines, and internal combustion engines - which include all gasoline engines, gas engines (natural, coal, and producer gas), and compressionignition engines - also has increased rapidly during the period covered. During the period 1939-1953 there was an increase of 31 p.c. in the capacity of hydraulic turbines and water wheels, 56 p.c. in the capacity of steam engines and steam turbines 115 p.c. in the capacity of electric motors, while internal combustion engines increased more than fivefold. The collection of statistics on power equipment was discontinued in 1949, but was collected again for 1953.

Power consumed by the manufacturing industries, purchased power as well as power generated for own use, totalled 46.5 billion K.W.H. in 1956, an increase of 140 p.c. as compared with 1939. Of the total consumed Quebec used 49.5 p.c., Ontario 27.4 p.c., British Columbia 13.9 p.c., Newfoundland 2.1 p.c., New Brunswick and Manitoba 1.9 p.c., and Alberta 14 p.c.

The non-ferrous metal products group with 33.1 p.c. of the total was the largest user of electric power in 1956. Prior to this, the paper products group held the premier position in this respect. Although non-ferrous metal products had a small edge on the consumption of electric power, the paper products group still is the largest user of purchased fuel and electricity. The paper products group was the second largest user of power in 1956 with 32.9 p.c. of the total, followed by products of petroleum and coal with 9.6 p.c., iron and steel products 7.2. p.c., non-metallic mineral products 4.5 p.c., and foods and beverages 2.7 p.c.

Table 55 gives details of purchased fuel and electricity as well as the K.W.H. consumption by industrial groups and provinces. Table 56 gives details of power equipment and Tables 57 and 58 give details of fuel consumption for selected years from 1926 to 1956.

¹ Since 1954 electricity previously reported as "Generated for own use" in the Fertilizer Industry in British Columbia, has been treated as "Electricity purchased". — Of the total "Generated for own use and for sale", approximately 1,905,000 M. kwh. were generated by thermal plant and 4,790,000 M. kwh. by hydro-electric plant.

¹ Exclusive of the Butter and Cheese industry in the province of Quebec in 1953.
² Not collected.
³ Includes manufactured and natural.
⁴ For 1926, 1929 and 1933, fuel and electricity used by "Dyeing, cleaning and laundry work" and by "Central electric stations" have been deducted from the totals in order to make the series comparable with current data.

Electricity purchased for metallurgical purposes in the Non-ferrous Metal Smelting and Refining is included for the first time.
 Newfoundland included.
 Included in the total.

Exclusive of the Butter and Cheese industry in the province of Quebec in 1953.
 Not collected.
 Includes manufactured and natural.
 Value only, available.

					11.		C					

For 1926, 1929 and 1933, fuel and electricity used by "Dyeing, cleaning and laundry work" and by "Central electric stations" have been deducted from the totals already published in order to make the series comparable with current data.

* Electricity purchased for metallurgical purposes in the Non-ferrous Metal Smelting and Refining is included for the first time.

* Included in total.

PART II. PROVINCIAL AND LOCAL DISTRIBUTION OF MANUFACTURING PRODUCTION

SECTION 1. TYPE AND CONCENTRATION OF MANUFACTURING PRODUCTION

This part of the Report is introduced by a general analysis of the concentration of the manufacturing industries in the provinces. In the sections that follow, the principal features of the manufactures of each province are brought out and finally the distribution of manufacturing throughout the principal cities and towns of Canada is shown.

Ontario and Quebec are by far the most important manufacturing provinces of Canada. Their combined production in 1955 amounted to \$17,277,601,319 or 80 p.c. of the total gross value of manufactured products. The proximity of Ontario to the coal-fields of Pennsylvania, the water power and other varied resources of the provinces, and their nearness to the

larger markets of Canada and the United States have all contributed to this progress.

Table 1 shows the outstanding predominance of Ontario and Quebec in each industrial group. Quebec leads in the manufacture of tobacco and tobacco products, textiles (except clothing), clothing (textile and fur), and paper products. In each of the other groups Ontario has the greater production of the two provinces. In the production of wood products British Columbia with 42 p.c. of the total holds the dominant position, outranking both Ontario and Quebec which account respectively for 25 and 22 p.c. of the total. In each of the other groups Ontario and Quebec lead by a wide margin.

TABLE 1. Summary Statistics of Manufactures of Each Province, Classified by Industrial Groups, 1956

¹ Confidential, Included with miscellaneous industries, ² Publication of these figures is authorized by the firms concerned, ³ Confidential, Includes all groups marked with 1,

Commenced, notices and products, groups.
 Includes printing and publishing, sheet metal products, jewellery and silverware, petroleum products, and acids, alkalies and salts.

The degree of concentration of manufacturing in large units is illustrated in Table 2. In Ontario 40.8 p.c. of all persons engaged in manufacturing were employed in establishments having 500 or more employees as compared with 36.9 p.c. for Canada as a whole. Ontario assumed the premier position in 1956, displacing Newfoundland which formerly ranked first.

Quebec ranked second with 38.0 p.c., followed by Newfoundland and Nova Scotia with 32.1 p.c., Yew Brunswick 31.1 p.c., British Columbia 27.5 p.c., Manitoba 24.5 p.c., and Alberta 18.6 p.c. There were no plants in either Prince Edward Island or Saskatchewan employing 500 or more persons.

TABLE 2. Concentration of Manufacturing Production in Each Province, 1956

SECTION 2. THE MANUFACTURES OF THE ATLANTIC PROVINCES

The Atlantic Provinces are of economic importance in a number of fields, such as pulp and paper, fish processing, sawmills and primary iron and steel. In Newfoundland manufacturing production is dominated by the forest and fisheries resources. Pulp and paper was the most important industry in 1956 with shipments valued at \$68,085,288, followed by fish processing with \$18,279,005. These two industries accounted for 70 per cent of the total production of the Province. In Prince Edward Island agriculture and fishing resources make butter and cheese, slaughtering and meat packing, and fish processing the leading industries. Nova Scotia is renowned for its coal mines and its fisheries as well as extensive forests and agricultural lands and is favoured with easy access by sea to the highgrade iron-ore supply of Newfoundland. On these resources are based the leading manufactures of primary iron and steel, fish processing, pulp and paper, shipbuilding and sawmills. In addition, an important petroleum refinery, railway rolling stock, cotton yarn and cloth and coke and gas plants add to the diversification of the Province. The forests of New Brunswick give a leading place to its pulp and paper and sawmilling industries. Other important manufacturing and processing activities are based on fish and agricultural resources.

Nova Scotia and New Brunswick, despite the lack of large rivers, have valuable sources of hydraulic power, a considerable portion of which has been developed. Tentative estimates give Newfoundland a potential of almost 1,000,000 h.p. at ordinary minimum flow, while in Labrador, the Hamilton River is outstanding as a potential source of power. Turbine installation at the end of 1956 totalled 336,750 h.p. in Newfoundland, 1,882 in Prince Edward Island, 177,018 in Nova Scotia and 164,130 in New Brunswick. Compared with Quebec, Ontario and British Columbia, the installed power in the Atlantic Provinces, is very small, amounting to 679,780 h.p. This compares with a total of 1,191,745 in the Prairie Provinces and 18,403,048 in the whole of Canada.

Manufacturing establishments reporting in 1956 numbered 3,381 for the Atlantic Provinces as a whole. These plants furnished employment to 35,774 persons who received \$178,707,950 in salaries and wages. They also shipped goods with a selling value at the factory of \$845,867,291 and spent \$464,478,173 for materials, while the value added by manufacture totalled \$353,904,067.

Considering the Atlantic Provinces as an economic unit, pulp and paper was the leading industry in 1956 with factory shipments valued at \$191,465,894. This was followed by fish processing with \$51,202,927, primary iron and steel \$51,321,212, sawmills \$44,251,499 and railway rolling stock \$33,758,676. These five industries accounted for 49 p.c. of the total value of factory shipments of the Atlantic Region. Other important industries, in order of value of factory shipments and with shipments valued at \$10,000,000 or more, were: petroleum products, sugar refining, butter and cheese, shipbuilding, bread and other bakery products, slaughtering and meat packing, sash, door and planing mills, miscellaneous food preparations, printing and publishing, prepared stock and poultry feeds, breweries, miscellaneous iron and steel products, and coke and gas products.

For the Atlantic Provinces as a whole there was an increase of 1.5 p.c. in the number of persons employed and 10.6 p.c. in the value of factory shipments in 1956 as compared with the previous year. Not all industries, however, shared in the advance. Of the leading industries, fish processing with a loss of 8.4 p.c. in the value of shipments reported the greatest decline. This was followed by sawmills with a drop of 4.9 p.c. and shipbuilding with a drop of 4.2 p.c. The majority of the leading industries with shipments of \$10,000,000 or more, however, reported increased shipments. The greatest gain of 97.4 p.c. was reported by the railway rolling stock industry, followed by primary iron and steel with 17.8 p.c. and pulp and paper 7.5 p.c. A notable feature of the 1956 manufacturing operations in the Atlantic Provinces was the expansion in the petroleum products industry in Nova Scotia, with shipments almost double the previous year.

Principal Statistics of the Atlantic Provinces, 1956

Province	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments	
	number		\$'000				
Newfoundland	783	10,502	30, 463	55, 452	62, 608	123, 691	
Prince Edward Island	192	1,775	3, 233	17, 807	6, 162	24, 497	
Nova Scotia	1,402	30,937	83,949	214, 779	159,820	384, 398	
New Brunswick	1,004	22, 560	61,063	176, 440	125, 314	313, 281	
Total	3,381	65,774	178, 708	464, 478	353, 904	845, 867	

in the Atlantic region the program of industrial development has been more selective than in some of the other provinces. Fish processing, new sawmills, increased pulp-making capacity and the manufacture of non-metallic building materials like cement and gypsum products have accounted for well over half of the industrial growth. There are however, a few outstanding exceptions. Two sizeable defence plants have been established in Nova Scotia, one to repair and overhaul naval aircraft and the other to build and repair radar and related electronic equipment. Considerable development has taken place in Newfoundland. Besides plants for the manufacture of cement and gypsum wallboard and plaster, factories for producing boots and shoes, birch veneer, leather goods, industrial machinery and a leather tannery were established, thus broadening the industrial base of the province. With these exceptions, most of the developments in the Atlantic Provinces have been either small and scattered or confined to the modernization and expansion of manufacturing facilities that were already established at the close of World War II.

In spite of the rapid development in the Atlantic Provinces since 1949 manufacturing production did not quite keep pace with the development in the more industrialized provinces of Ontario, Quebec and British Columbia, This is indicated by a

slight drop in the Atlantic Provinces' share of the Canadian total from 4.52 in 1949 to 3.33 in 1956. In number of persons employed there was an increase of 2.4 per cent for the Atlantic Provinces as compared with an increase of 15.3 per cent for Canada as a whole. For salaries and wages paid the increase was 49.3 per cent as compared with 76.2 per cent for Canada, and in selling value of factory shipments the increase was 46.6 per cent for the Atlantic Provinces and 73.2 per cent for Canada as a whole.

Up to 1952 the increase in employment in the Atlantic Provinces was about the same as for Canada as a whole. Between 1953 and 1955, however, employment in the Atlantic Provinces declined by 6.0 p.c. while for Canada as a whole the decline was only 2.2 p.c. In 1956 the same situation prevailed. Employment in the Atlantic Provinces rose by 1.5 p.c. as compared with 1955, while for Canada as a whole the increase was 4.2 p.c. The increased employment since 1949 reported by Newfoundland, Prince Edward Island and Nova Scotia was offset by a drop 3.8 p.c. in New Brunswick, resulting in a net increase of only 2.4 p.c. for the Atlantic Provinces as compared with an increase of 15.3 p.c. for Canada. Selling value of factory shipments was 46.6 p.c. higher in the Atlantic Provinces while for Canada as a whole it was 73.2 p.c. higher.

SECTION 3. THE MANUFACTURES OF QUEBEC

Quebec with about 30 per cent of Canada's total selling value of factory shipments ranks as the second largest industrial province in Canada. The manufacturing industries of Quebec in 1956 shipped goods with a record selling value at the factory of \$6,522,502,699 and represents an increase of 11.8 p.c. over the previous year. Accompanying the increase in shipments was an increase of 3.9 p.c. in the number of persons employed which totalled 446,137. Although the value of factory shipments in 1956 was 22.9 p.c. higher than in 1953 the number of persons employed increased only by 1.0 p.c. This result conforms to the trend in recent years for employment to increase at a lower rate than volume of production. With the increase in automation and technological improvements this trend should continue even at a more accelerated pace. Indicative of this trend is the increase since 1949 for Canada as a whole of 31.8 p.c. in the volume of production as compared with an increase of only 15.5 p.c. in the number of persons employed. Since indexes of volume of production are not available by provinces no comparison can be made for Quebec. There is no doubt, however, that the volume of production in Quebec in 1956 was the highest on record.

The recovery in 1955 from the minor recession of 1954 continued at an accelerated pace in 1956. All groups reported higher value of shipments in 1956 as compared with the previous year. For the province as a whole the increase was 11.8 p.c. as compared with an increase of 10.9 p.c. for Canada. In employment too, all groups with the exception of three reported increases. Employment in the clothing group which provides work to the greatest number of workers was about the same as in 1955, Employment in the chemicals and allied products group was slightly lower, while the products of the petroleum and coal group reported a drop of 9.4 p.c. For manufacturing as a whole in Quebec there was an increase of 3.9 p.c. in the number of persons employed as compared with an increase of 4.2 p.c. for Canada.

Indexes of physical volume measure changes in production more accurately than any other indicators. Since such indexes are not available for provinces, changes in employment have to be considered as reflecting more or less the growth or decline of the various sectors of the manufacturing field. In comparing the changes in employment between the record high of

Reported on a production basis,
 Includes: Biscuits; Breweries; Brass and copper; Brooms, brushes and mops; Cement, hydraulic; Railway rolling stock; Synthetic textiles;
 Shipbullding and Sugar refining.

1953 with that of 1955 it is found that in spite of an increase of 22.9 p.c. in value of shipments for the province as a whole, employment went up only 1.0 p.c. during the same period. The greatest decline in employment since 1953 was reported by the transportation equipment group with a drop of 22.4 p.c. This was followed by products of petroleum and coal with a drop of 6.7 p.c., leather products 6.6 p.c., clothing 5.2 p.c., and textiles 3.0 p.c. All the other groups reported more employees in 1956 than in 1953. Of these, electrical apparatus and supplies with an increase of 18.8 p.c. reported the greatest expansion in production. This was followed by non-metallic mineral products with 17.1 p.c., paper products 14.5 p.c., printing, publishing and allied industries 9.8 p.c., rubber goods 9.5 p.c., non-ferrous metal products 6.4 p.c., miscellaneous industries 6.4 p.c., foods and beverages 5.0 p.c., iron and steel products 4.5 p.c., chemicals and allied products 2.6 p.c., knitting mills 2.1 p.c., wood products 2.1 p.c. and tobacco and tobacco products 1.4 p.c.

Quebec has developed its \$6.6 billion manufacturing output with such leading industries as pulp and paper, non-ferrous metal smelting and refining, petroleum products, slaughtering and meat packing, cotton yarn and cloth, men's and women's clothing, tobacco, cigars and cigarettes, synthetic textiles and silk, railway rolling stock, leather footwear and miscellaneous electrical apparatus. In common with the rest of Canada, Quebec experienced a great industrial expansion following the second World War. Nor was this expansion confined to the existing industrial areas, but spread to many towns and villages in the accessible areas of the province.

Quebec's leading industry is pulp and paper with an output of approximately \$618 million in 1956. Quebec is a principal world centre for the production of newsprint with 55 major pulp and paper plants concentrated in the Trois Rivieres and Shawinigan Falls districts as well as along the Saguenay, Ottawa, and St. Lawrence rivers. The production of non-ferrous metals has expanded considerably during the past decade. The output of aluminum in Canada has made impressive strides during the past years and reached a record total of 620,321 tons in 1956. After the end of the war, with the disappearance of the demands for defense, surplus productive capacity appeared. New civilian uses were found to take up the slack, so that by 1948 the industry was producing 75 p.c. of its peak wartime output. To this has been added the defense demands created by the Korean war and in 1952 the peak level of production attained in 1943 has again been reached. Quebec, with its new furniture factories, its new titanium smelter and its expanded aluminum-making facilities, is challenging Ontario's long established lead in a number of the wood and non-ferrous metal products industries.

There are several important factors which contributed to the great industrial development of the Province. To begin with, the geographic situation of the Province is extremely favourable, with an excellent large harbour 800 miles inland where seagoing vessels of heavy tonnage can dock. There is also an extensive highway system linking the small rural areas to the big industrial centres. Other significant factors include abundant forest resources, water power, minerals, agricultural lands and, of even more importance, an industrious and stable population.

Quebec is the richest of the Canadian provinces in both developed and undeveloped waterpower resources. Its present installation, approaching 8,500,000 h.p., is more than 45 p.c. of the Canadian total. The Quebec Hydro-Electric Commission's Beauharnois development on the St. Lawrence river, with present capacity of 1,408,000 h.p., is to be expanded to a capacity of more than 2,000,000 h.p. The Shipshaw plant of the Aluminum Company of Canada on the Saguenay River is rated at 1,200,000 h.p. On the St. Maurice River, the Sha-Winigan Water and Power Company operates seven hydro-electric plants with a total capacity of 1,695,000 h.p. Up to 1955, two of these developments were the largest in the country. The completion of the Sir Adam Beck-Niagara Generating Station No. 2 on the Niagara River which raised the combined capacity of Stations Nos. 1 and 2 to 1,820,000 makes it the largest single installation in Canada.

Two of the most important industrial developments in Quebec today are the Ungava from ore project and the new titanium industry. With the exploitation of the Ungava iron deposits on which it is believed, the future of the great steel industries of this Continent rests, Quebec's industrial base is being expanded to the point where the future industrial development of this Province is well assured.

Quebec's industries are not as diversified as those of Ontario, although a number have an output approximately half or more of the total Canadian production. The manufacture of pulp and paper occupies the premier position. Fifty years ago this industry had hardly come into existence in the Province and in the mid-1920's the annual gross value of production had not yet reached \$100,000,000. By the end of 1956 it accounted for about 9 p.c. of the gross value of Quebec's manufactures and for about 42 p.c. of the Canadian total for this industry. Other large Canadian industries in which Quebec predominates are: tobacco, cigars and cigarettes 93.1 p.c. of the Canadian total; women's factory clothing 69.9 p.c., cotton yarn and cloth 97.7 p.c., men's factory clothing 56.2 p.c., synthetic textiles and silk 51.8 p.c., miscellaneous electrical apparatus and supplies 46.5 p.c., non-ferrous metal smelting and refining 43.7 p.c., pulp and paper 42.5 p.c., railway rolling stock 42.0 p.c., miscellaneous chemical products 40.3 p.c., brass and copper products 40.1 p.c., acids, alkalies and salts 39.8 p.c., aircraft and parts 37.1 p.c., and petroleum products 35.0 p.c. Two medium-sized industries with Canada shipments of over \$100,000,000 also predominated in Quebec. These were leather footwear with 57.8 p.c. and medicinal and pharmaceutical preparations 47.1 p.c.

Quebec also predominates in a large number of the smaller industries. The candle industry contributed 95.2 p.c. of the Canadian total, men's clothing contractors 93.7 p.c., women's clothing contractors 82.2 p.c., cotton thread 79.5 p.c., children's clothing 76.9 p.c., embroidery, pleating and hemstitching 76.0 p.c., oiled and waterproofed clothing 75.3 p.c., dyeing and finishing of textiles 75.2 p.c., oilcloth, linoleum and other coated fabrics 73.0 p.c., narrow fabrics 72.5 p.c., fur dressing and dyeing 72.3 p.c., process cheese 70.9 p.c., lasts, trees and shoe findings 98.8 p.c., boot and shoe findings, leather 68.8 p.c., artificial flowers and feathers 67.8 p.c., miscellaneous clothing 67.4 p.c., miscellaneous clothing 67.4 p.c., miscellaneous textiles 61.4 p.c., fur goods 59.6 p.c., corsets 58.5 p.c., buttons, buckles and fasteners 51.6 p.c., asbestos products 50.5 p.c., woollen cloth 38.4 p.c., etc.

Manufacturing establishments reporting in 1956 numbered 12,112. These plants furnished employment to 446,137 persons who received \$1,396,414,564 in salaries and wages. They also shipped goods with a selling value at the factory of \$6,522,502,699 and spent \$3,605,521,666 for materials. The value added by manufacture totalled \$2,888,148,758.

The value added is obtained by subtracting the cost of materials, including fuel and electricity, from the gross value of products. The difference represents the value added to the materials by labour. It is this difference which the employer of labour uses to pay for the labour itself, the overhead expenses, interest and profits.

To calculate the value of production, it is necessary to adjust the value of shipments for the difference in the opening and closing inventories of finished goods. As the census of industry schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added is obtained by subtracting from the shipments the cost of materials, including fuel and electricity. The value thus obtained is somewhat different to the actual value. Beginning with 1954 it is again possible to obtain value of production figures, by adding to the value of shipments the changes in the inventory of finished products. The figures for value added in 1954 and 1955 are, therefore, comparable with 1951 and prior years.

SECTION 4. THE MANUFACTURES OF ONTARIO

The manufacturing industries of Ontario in 1956 reported \$10,655,098,620 as the selling value of factory shipments, an increase of 10.8 p.c. over the previous year. This is the first time that shipments passed the ten billion mark and accordingly are the highest on record. Accompanying the increase in shipments was an increase of 4.5 p.c. in the number of employees which totalled 641,190 in 1956, Although the selling value of factory shipments in 1955 and 1956 exceeded the previous high reported in 1953 by 20 p.c., the number of persons employed was only 6,636 or 1.0 p.c. higher. This result conforms to the trend in recent years for employment to increase at a lower rate than volume of production, With the increase in automation and technological improvements this trend should continue at a more accelerated pace. Indicative of this trend is the increase since 1949 for Canada as a whole of 31.8 p.c. in the volume of production as compared with an increase of only 15.5 p.c. in the number of persons employed. Since indexes of volume of production are not available by provinces no comparison can be made for Ontario. There is no doubt, however, that the volume of production in Ontario in 1956 was the highest on record.

As Ontario is a major producer of durable goods, such as transportation equipment, primary iron and steel, telecommunication equipment and heavy electrical machinery, it therefore experiences wider fluctuations in manufacturing production than provinces producing nondurable or consumer goods. As a result, the small downturn of 1954 was more keenly felt by Ontario manufacturers. Factory shipments in that year were 3.9 p.c. lower as compared with a drop of 1.3 p.c. for Canada as a whole, while in employment the drop in Ontario was 5.6 p.c. while for Canada it was 4.5 p.c. Conversely, with the improvement during the past two years Ontario in 1956 reported an increase of 24.9 p.c. in factory shipments and 7.1 p.c. in employment as compared with 1954. This compares with increases of 23.3 p.c. and 6.7 p.c. for Canada as a whole.

Ontario, which is now recognized as one of the world's major industrial areas, accounts for approximately half of Canada's manufacturing production. Here, the proximity of raw materials, cheap hydro-electric power, and a strategic location in relation to export markets, not only on this continent but overseas, have been the decisive factors in the development of Ontario to its present industrial position. Most of the manufactures of the province and most of its population are located in Southern Ontario. This area has the inestimable advantage of bordering on the St. Lawrence-Great Lakes waterway system which gives access westward to the heart of the continent and eastward to the shipping routes of the world, and which is also the source of most of Ontario's hydro-electricity. Many new industrial areas are being created as new industries and branch plants of established industries are increasingly being located in the smaller towns.

Despite the great industrial progress made by other provinces, Ontario continues to maintain its predominance and in 1956 produced about 49 per cent of the nation's manufactured goods. A vast increase of steel ingot capacity is being made possible by developments at Steep Rock Iron Mines. At Sarnia, huge investments have gone into the construction of new plant plant for a whole group of new products based on Alberta oil flowing through the Edmonton-Superior pipe line. Other significant developments are taking place in synthetic rubber, synthetic textiles, and industrial and consumer chemicals. Ontario has continued to gain in such traditional lines as motor vehicles, industrial and farm machinery, and the manufacture of household equipment. The same may be said of other "hard" goods like business and office machinery and electrical apparatus and supplies. Numerous plants making aircraft components and building materials have favoured the Toronto area, while chemical and synthetic textile plants have been rising in the vicinity of Sarnia and along the lower reaches of the St. Lawrence River Between Cornwall and Kingston.

Ontario has the greatest diversification of manufacturing production of any province. Certain industries, such as the manufacture of motor vehicles, motor vehicle parts, heavy electrical machinery, agricultural implements, machine tools, starch and glucose, bicycles and the processing of raw tobacco are carried on practically in this province alone. Of the forty leading industries in Canada in 1956, a substantial number of them were dominated by Ontario's share of the total production. These industries, with the percentage which the production of each bears to that of the 1956 Canada totals are as follows: motor vehicles 98.8, motor vehicle parts 95.4, heavy electrical machinery 89.7, rubber goods 81.5, primary iron and steel 78.1, telecommunication equipment 76.7, iron castings 71.9, fruit and vegetable preparations 67.4, sheet metal products 59.7, wire and wire goods 58.4, aircraft and parts 58.1, industrial machinery 57.4, printing and bookbinding 57.3, brass and copper products 55.1, miscellaneous chemical products 54.6, acids, alkalies and salts 53.0, boxes and bags, paper 52.0, miscellaneous electrical apparatus 50.6, furniture 49.7, printing and publishing 48.7, synthetic textiles 44.9, and stock and poultry feeds 44.3.

There are also a number of medium-sized industries with a total Canadian production of over \$100,000,000 in which Ontario dominated. Agricultural implements with 90.5 p.c., soaps and washing compounds 88.5 p.c., household and office machinery 80.0 p.c., refrigerators, vacuum cleaners, etc. 79.5 p.c., hardware, tools and cutlery 72.8 p.c., heating and cooking apparatus 68.7, and confectionery 57.2 p.c., were in this category.

In addition Ontario dominated many of the smaller industries in 1956 as is indicated by the following percentages of the Canadian total. In this category were: machine tools 100.0, tobacco processing and packing 93.8, bicycles and parts 92.9, non-ferrous metal products 92.3, prepared breakfast foods 90.5, automobile accessories, fabric 88.6, wine 88.1, typewriter supplies 86.5, leather tanneries 84.3, artificial abrasives 83.8, cordage, rope and twine 77.5, sporting goods 76.0, carpets, mats and rugs 75.7, batteries 73.1, white metal alloys 72.8, jewellery and silverware 71.9, toys and games 71.5, wool yarn 70.2, feed mills 69.9, aluminum products 64.8, animal oils and fats 61.3, boilers, tanks and plate work 55.3, knitted goods, other than hosiery 47.9, hosiery 44.3, etc.

Establishments reporting in 1956 numbered 13,215. They furnished employment to 641,190 persons who were paid \$2,310,334,396 in salaries and wages, and spent \$5,683,753,088 for materials used. The value added by manufacture which is the calculated value of production less the cost of materials used, including the cost of fuel and electricity, amounted to \$4,888,570,251, while the selling value of factory shipments totalled \$10,655,098,620.

The value added is obtained by subtracting the cost of materials, including fuel and electricity, from the gross value of products. The difference represents the value added to the materials by labour. It is this difference which the employer of labour uses to pay for the labour itself, the overhead expenses, interest and profits.

To calculate the value of production, it is necessary to adjust the value of shipments for the difference in the opening and closing inventories of finished goods and goods in process. As the census of industry schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added is obtained by subtracting from the shipments the cost of materials, including fuel and electricity. The value thus obtained is somewhat different to obtain value of production figures, by adding to the value of shipments the changes in the inventory of finished products and goods in process. The figures for value added since 1954 are, therefore, comparable with 1951 and prior years.

SECTION 5. THE MANUFACTURES OF THE PRAIRIE PROVINCES

The leading industries of the Prairie Provinces are those based on agricultural resources-grain-growing, cattle-raising and dairying areas. Next in importance, generally, are industries providing for the more necessary needs of the resident population, such as the baking of bread, printing and pubblishing, etc. The extensive railway services require large shops for the maintenance of rolling-stock, especially in the Winnipeg area. The widespread use of motor vehicles and power machinery on farms has given rise to petroleum refineries in each province. This industry has made tremendous strides in the Prairie Provinces since 1949. At that time it ranked third in importance, being outranked by slaughtering and meat packing which was then in first place and by flour mills which ranked second. In 1956 it assumed the premier position in the Prairie Provinces in selling value of factory shipments. Of greater significance is the fact that it has increased its proportion of the total manufacturing production of the Prairie Provinces from 8.5 p.c. in 1949 to 16.5 p.c. in 1956. Manitoba, as the early commercial centre of the prairies, has had a greater industrial development than either of the other provinces. Its natural resources of accessible water power, forests and, more recently, minerals, have given rise to quite a diversification of industrial production. In Saskatchewan, while the main economic role continues to be played by agriculture, both oil and mineral wealth are being developed.

Considering the Prairie Provinces as an economic unit, petroleum products, as was mentioned before, had the largest value of factory shipments in 1956, amounting to \$272,367,057, followed closely by slaughtering and meat packing with \$264,886,950, flour mills \$99,572,619, butter and cheese \$94,256,285 and railway rolling stock \$50,364,723. These five industries accounted for about 47 p.c. of the total value of factory shipments of the Prairie Provinces. Other leading industries, in order of value of factory shipments and with shipments of \$15,000,000 or more were: bread and other bakery products, printing and publishing, breweries, bridge and structural steel, men's factory clothing, sash, door and planing mills, miscellaneous food preparations, furniture, sawmills, sheet metal products, concrete products, printing and bookbinding, sugar refining, hydraulic cement, prepared stock and poultry feeds, pulp and paper, primary iron and steel, and carbonated beverages. Non-ferrous metal smelting and refining is also a major industry in the Prairie Provinces. Information concerning it cannot, however, be published without disclosing the operations of individual establishments.

In water-power resources, the Prairie Provinces are not so well endowed as the more highly industrialized provinces of Quebec, Ontario and British Columbia. At the end of 1956 power installation in the three Provinces totalled only

1.191.745 h.p. or about 6 p.c. of the Canadian total, Manitoba had 796,900 h.p., Saskatchewan 109,835 h.p. and Alberta 285,010 h.p. With the present developments of natural gas and oil, the Prairie Provinces, will in large measure be able to overcome a lack of water-power resources which is so vital to industrial development. Manitoba has more water-power resources and has developed them to a greater extent than either of the other Prairie Provinces. Practically all the developed sites are located on the Winnipeg River. These supply not only Winnipeg and its suburban areas but, also more than 400 municipalities and a large part of rural areas of southern Manitoba where farm electrification is a primary objective. In Saskatchewan, water-power development is confined to the northern mining districts. The southern portions of Saskatchewan and Alberta are lacking in water-power resources but have fuel reserves. In Alberta, present developments are located in the Bow River basin and serve Calgary and numerous other municipalities between the International Boundary and the area north of Edmonton.

In the Prairie Provinces, the nature of developments vary from one province to another. Alberta has moved to the forefront, especially since 1950. There the emphasis has been more on the manufacture of machinery and equipment for the burgeoning oil and gas industries. Chemicals, and especially petrochemicals, have made striking gains; second in terms of new growth, they now embrace various rayon intermediates and polythene plastics, as well as fertilizers and the manufacture of other new inorganic products like caustic soda and chlorine. Sizeable gains have been made by the expansion of food-processing plants and the construction of still more factories for making building materials.

Developments in Saskatchewan, by contrast, have continued along more or less traditional lines. The largest gains, for instance, have been recorded in food processing. The manufacture of building materials, including non-metallic mineral products and lumber, has also increased. However, the largest

single gain in employment has been in the refining of prairie oil for local use.

Although Manitoba experienced considerable development in manufacturing production since 1949, it did not, percentagewise, keep pace with the other two Prairie Provinces. The change was not so much in the magnitude but rather in the nature of manufacturing production. The emphasis has shifted from the production of food and clothing to the production of products of mineral origin, such as iron and steel, non-metallic mineral products and products of petroleum and coal. There was also a wider diversification of products as is evidenced by the increase of 258 employees in the miscellaneous group. For manufacturing as a whole the increase in the number of persons employed totalled 865. The largest increase of 768 was reported by the iron and steel group. The non-metallic mineral products group with 511 reported the second largest increase, followed by electrical apparatus and supplies with 416. products of petroleum and coal 344, miscellaneous industries 258 and paper products 167. Only three groups reported major declines in employment: foods and beverages 704, clothing, including knitting mills 577 and wood products 170. The foods and beverages group which in 1949 accounted for 25 p.c. of the employment in manufacturing, accounted for only 23 p.c. of the total in 1956. The foods and beverages group with 9,922 employees was still in first place in 1956 as an employer of labour. This was followed by transportation equipment with 6,604, clothing 5,728, iron and steel products 5,542, printing and publishing 3,793 and wood products 3,033. These six groups accounted for 81 p.c. of the manufacturing employment in Manitoba.

According to Table 1, manufacturing establishments in 1956 numbered 4,303 for the Prairie Provinces as a whole. These plants furnished employment to 91,149 persons who received \$290,384,459 in salaries and wages. They also shipped goods with a selling value at the factory of \$1,648,781,413 and spent \$955,034,201 for materials, while the value added by manufacture totalled \$669,475,007.

Principal Statistics of the Prairie Provinces, 1956

Province	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments	
	number		\$'000				
Manitoba	1,534	42,821	133,506	367,025	270,018	647,389	
Saskatchewan	798	11,536	36,683	176,871	113,628	298, 203	
Alberta	1,971	36,792	120, 195	412,138	285,831	703, 189	
Total	4,303	91, 149	290,384	956, 034	669, 477	1,648,781	

In spite of the rapid development in the Prairie Provinces since 1939, manufacturing production did not keep pace with the developments in the more industrialized provinces of Ontario, Quebec and British Columbia, This is indicated by the slight drop in the Prairie Provinces' share of the Canadian total from 8.13 p.c. in 1939 to 7.91 p.c. in 1953. In 1954 conditions were reversed. The Prairie Provinces reported an increase of 1.4 p.c. in the value of factory shipments as compared with a decline of 1.3 p.c. for Canada as a whole. As a result of this the Prairie Provinces' share of the Canadian

total was again 8.13 p.c., the same as in 1939. In 1955 and 1956, however, the situation deteriorated again with the percentage of the total dropping to 7.52.

According to the table below, Manitoba and Saskatchewan did not keep pace with manufacturing developments in Canada as a whole, Alberta on the other hand fared much better. Compared with 1949 employment increased by 39.2 p.c. and value of factory shipments by 89.0 p.c. This compares with increases for Canada as a whole of 15.5 p.c. and 73.4 p.c. respectively.

Variation in Employment and Factory Shipments, 1956 Compared with 1949

Province	Employees	Earnings	Selling value of factory shipments
		per cent	
Manitoba	. + 2.1	+ 55.1	+36.4
Saskatchewan	. + 6.4	+ 61.3	+38.2
Alberta	120 3	+118.1	+89.0
Prairie Provinces		+ 77.1	+55.2
Canada	±18 K	+ 76.3	+73. 4

2 Includes; Fertilizers, Non-ferrous metal smelting and refining, Primary plastics, Railway rolling stock, and Sugar refining.

SECTION 6. THE MANUFACTURES OF BRITISH COLUMBIA

British Columbia, with factory shipments valued at \$1,859,368,466, ranked third among the provinces in manufacturing production. In spite of the rapid industrialization of other provinces, British Columbia succeeded in increasing its share of the total Canadian output. This is reflected in the increase in the total from 7.1 p.c. in 1939 to 8.6 p.c. in 1956.

Forest resources, fisheries, minerals and electric power have given a broad base and wide diversification to its industrial development. While Ontario and Quebec have an outstanding predominance in each of the major industrial groups of the Standard Industrial Classification, in the production of wood products, however, British Columbia with 42 p.c. of the Canadian total holds the dominant position, outranking both Ontario and Quebec which account respectively for 25 and 22 p.c. of the total.

Emphasizing the importance of the forests in the industrial life of the Province, the sawmilling industry ranked first with a gross value of factory shipments of \$397,934,856, and pulp and paper second with \$184,526,395. Third in importance was the petroleum products industry with factory shipments valued at \$123,235,472. This industry received a great impetus in the completion of the Trans-Mountain oil pipeline. In 1953, with

shipments valued at \$40.562,462 it ranked seventh, and contributed about 3 p.c. to the total value of factory shipments of the Province. In 1954 it assumed third place with the proportion of the total increasing to 5.5 p.c., with a further increase to 6.6 p.c. in 1956. In fourth place was veneer and plywood with \$87,532,258 while in fifth place was fish processing, based principally on the estuarial salmon fisheries. This industry was in third place in 1953. British Columbia accounted for approximately 48 p.c. of the output of the fish processing industry in 1953 and plays a large part in making Canada the largest fish exporting nation in the world. Other important industries are: sash, door and planing mills, slaughtering and meat packing, miscellaneous food preparations, shipbuilding, fertilizers, printing and publishing, butter and cheese, fruit and vegetable preparations, bridge and structural steel, etc. The non-ferrous metal smelting and refining industry also ranks high among the leading industries. Information, however, cannot be published as there are less than three smelters located

A feature of recent progress has been that new developments are taking place in areas far removed from accepted industrial centres. Growing lines of communication and transportation are fanning out from and leading into formerly locked interior communities to tap a vast new potential and offer new sources of provincial economic unity and strength. Factories and plants in remote sections are drawing greater value in employment and dollars from natural resources. The growth of the province industrially may be indicated by the increase in employment which is two and one-half times the pre-war figure. In dollar terms, gross value of manufacturing is also up 350 p.c. since 1939. The consumption of 6.5 billion kwh of electric power by manufacturers during 1955 marks a steady upward climb of 200 per cent in the past decade.

British Columbia ranks second among the provinces in available water-power resources and its hydraulic development which at the end of 1953 totalled 2,565,480 h.p., out of a Canadian total of 18,403,048 h.p., is exceeded only by Quebec and Ontario. Present developments are practically all located in the southern part of the province in the Fraser and Columbia River Basins. The Aluminum Co. of Canada is making excellent progress in its great Kemano-Kitimat scheme, involving diversion of the head-waters of the Fraser River through the coastal range by a ten-mile tunnel to an underground powerhouse. The highlight of hydro-electric construction in 1955 was the completion of the first stage of this project. The first four turbines, each of 150,000 h.p. were brought into operation. A fifth unit of 150,000 h.p. is scheduled for completion in 1957, and the ultimate capacity is expected to be about 2,000,000 h.p. This power will be used in the production of aluminum which is a new product for British Columbia. Present capacity of the smelter is 90,000 tons of aluminum per annum, with a potential of 550,000 tons, a production which will further strengthen Canada's position as an important source of this vital metal.

Manufacturing establishments reporting in 1956 numbered 4,393. These plants furnished employment to 108,595 persons who received \$393,869,383 in salaries and wages. They also shipped goods with a selling value at the factory of \$1,859,368,456 and spent \$1,007,882,346 for materials, while the value added by manufacture totalled \$824,249,273.

The manufacturing industries of British Columbia expanded during 1954, at a time when the rest of Canada experienced a minor recession. For Canada as a whole there was a drop of 4.5 p.c. in the number of employees and 1.3 p.c. in the value of shipments. British Columbia was the only province in 1955 reporting increased employment, the increase being 2.2 p.c. Although British Columbia was not the only province to report increased shipments that year, the increase of 7.9 p.c. was, however, the highest of any province. In common with other provinces, manufacturing in British Columbia continued to expand during 1955 and 1956. Of all provinces British Columbia reported the greatest increase in employment and value of factory shipments, Since 1953 employees were 15.7 p.c. higher as compared with an increase of only 1.9 p.c. for Canada, while the value of factory shipments were 36.0 p.c. higher for British Columbia and 21.7 p.c. for Canada as a whole.

Reported on a production basis.

² Non-ferrous metal smelting and refining is also a leading industry. Statistics, however, are confidential since there are less than three firms reporting.

SECTION 7. MANUFACTURING INDUSTRIES IN URBAN CENTRES

The prosperity of most of the cities and towns of Canada, especially in the east, is intimately connected with their manufacturing industries, which provide employment for a large proportion of their gainfully occupied population. In the west the cities are more largely distributing centres, though manufactures are rapidly increasing there also.

Table 15, indicating the extent to which the manufacturing industries of Canada are concentrated in urban centres, shows by provinces the proportion contributed by cities and towns having factory shipments of over \$1,000,000 each. In the more highly industrialized provinces of Ontario and Quebec such cities and towns in 1959 accounted for 78 p.c. and 94 p.c. respectively of the totals for those provinces, while for the Atlantic Provinces and British Columbia, where sawmilling, fish-packing, and dairying are leading industries, the propor-

tions are 69 p.c. and 49 p.c. respectively. In the Prairie Provinces manufacturing is confined to a few urban centres.

During the past few years there has been a noticeable trend for manufacturing plants to locate in rural areas adjacent to incorporated cities and towns. This trend is revealed by a study of the percentages in the table below during the past few years. In 1956 for Canada as a whole 79.3 p.c. of the shipments were made by cities and towns with factory shipments of \$1,000,000 and over, as compared with 86.9 p.c. in 1953. Toronto is a good case in point. In 1953 Toronto accounted for 72.0 p.c. of the total shipments of York County and the rural areas for 12.2 p.c., while in 1955 Toronto's share dropped to \$0.3 p.c. with the rural areas increasing to 23.9 p.c. The same trend is apparent in other manufacturing centres. This accounts for the changes that have taken place during the past few years in some of the provinces and for Canada as a whole.

TABLE 15. Cities and Towns Each with Selling Value of Factory Shipments of Over \$1,600,000, Number of Establishments and Total Shipments in such Urban Centres as a Percentage of the Grand Total, by Provinces, 1956

Note. Statistics published in this table are in some cases higher than the figures published in Table 18, since in the table below are included towns with shipments of over \$1,000,000 for which statistics must be withheld. It is not possible to publish this information in Table 18 without disclosing the operations of individual establishments.

¹ Net value is derived from gross value by deducting cost of materials, fuel and electricity. For cost of fuel and electricity in 1956 see Table 18.
² Since 1952 the basis of collection was "Selling Value of Factory Shipments" instead of "Gross Value of Products".

TABLE 17. Principal Statistics of the Manufacturing Industries Located in the Metropolitan Areas of Montreal, Toronto, Hamilton, Windsor, Winnipeg and Vancouver, Grouped According to the Number of Employees per Establishment, 1956

Metropolitan area, by size group	Estab- lish- ments	Employees	Salaries and wages	Cost of fuel and electricity	Cost at plant of materials used	Selling value of factory shipments

APPENDIX II

Alphabetical List of the Products Reported as having been Manufactured in Canada in 1956

The appended list of the products of Canadian manufacturing industries presents the value and in most cases the quantity of the individual products in a much more detailed form. Prior to 1927, in presenting statistics of manufacturing production, the whole production of an establishment was taken as a unit. This not only prevented the presentation of production figures for specific products in detail, but also involved numerous inaccuracies in the production statistics of classes of commodities, owing to the fact that commodities which may be the major line of production in one establishment may also be products of secondary importance in another establishment where the major line of production puts the establishment into a different class. The statistics which follow, however, have been compiled by taking from the individual returns of each of the 37.428 manufacturing establishments covered, the value and, when given, the quantity of each commodity specified as produced by the establishment. In this way, detailed production figures are obtained for specific commodities and, furthermore, the total production of each commodity is brought together, no matter how varied may be the operations in different establishments producing it. Nevertheless it should be pointed out to those making use of these figures that there is one element of incompleteness about them. In the returns of many manufacturers, products of minor importance are grouped under the name "all other products". As will be seen from the group at the end of the list, the value of products not specified, while they may appear unimportant to the individual manufacturer, are, in the aggregate, a large amount, especially in the industries of two of the larger groups. It is obvious that one manufacturer may consider a product of insufficient importance to report separately for his establishment, while that same product may be reported separately by other establishments. In other words, included in the value of other products not specified at the end of the list, there are doubtless values which, had the products been specified by manufacturer, would have been included in values of commodities appearing on the list. However, the products not specified total only about 2.1 per cent in value of the whole manufacturing production, although in the iron and steel group this proportion is 5.1 per cent and in transportation equipment 7.2 per cent. With the exception of these groups, therefore, the incompleteness of the figures on this account is insignificant.

There is no duplication in the listing of products, nor do any of the items, include products listed in more detail under another name. It is possible, however, that essentially the same commodity produced in different establishments may have been called by different names; in such a case, which is probably a very rare one, the items would appear separately in the following list.

It should be noted that a shipments' concept instead of the value of production concept was adopted in 1952. Items still collected on a production basis are marked with an asterisk.

Alphabetical List of Commodities, 1956

Note: In 1952 and subsequent years the basis of collection, is "Value of Factory Shipments" instead of "Gross Value of Products". However, the commodities marked * are still on a production basis.

GENERAL REVIEW OF THE MANUFACTURING INDUSTRIES OF CANADA 1957

DOMINION BUREAU OF STATISTICS
Industry and Merchandising Division

DOMINION BUREAU OF STATISTICS Industry and Merchandising Division

GENERAL REVIEW

OF THE

MANUFACTURING INDUSTRIES OF CANADA

1957

Published by Authority of
The Honourable Gordon Churchill, Minister of Trade and Commerce

PREFACE

The present review of the manufacturing industries of Canada is based on the data obtained from the survey of manufactures made annually by the Industry and Merchandising Division of the Bureau. In addition to data on production, employment, salary and wage payments, consumption of materials, fuel and electricity, size of establishment and type of ownership the review also contains data on manufacturing compiled by other Divisions of the Bureau, such as weekly and hourly earnings, hours worked, capital investment, volume of production, etc. The main purpose of the review is to supply historical background of the principal factors involved in manufacturing production in Canada. Besides general analyses for Canada as a whole, data for each province, county or census division as well as cities and towns, are also given. A feature of the review is the "Alphabetical List of Products Manufactured in Canada" which gives Canada totals for about 3,000 individual commodities. As the basis of classification for the annual survey of manufactures is the "Industry" and not the "Commodity" the same commodity may, therefore, be produced by more than one industry. To obtain a total for each commodity its production in the different industries is summarized on a ledger card which is maintained for each commodity.

The general review of the manufacturing industries of Canada, as a separate report, dates back about thirty years and has been prepared since its inception under the direction of Mr. A Cohen, Assistant Director of the Industry and Merchandising Division who wrote the text and prepared the analytical tables contained in the volume.

WALTER E. DUFFETT,

Dominion Statistician.

November 1, 1959

PART I. GENERAL ANALYSES OF MANUFACTURING

SECTION 1. GROWTH OF MANUFACTURING

Subsection 1. Definitions and Concepts Used in Compiling Manufacturing Statistics

The statistics compiled by the annual survey of manufactures given in the present report cover the number of establishments, employees, salaries and wages, cost of materials, supplies, fuel and electricity, value of shipments, inventories and value added by manufacture. The concepts used in determining a manufacturing establishment and a short definition of each of the above principal statistics is outlined in the paragraphs following:

The Establishment. — There is general agreement that in most cases the smallest unit for which data can be obtained, and which is therefore classifiable to an industry, is the establishment. The establishment is thus an operating unit having an independent existence in the sense that it contains within itself all of the elements needed for the activities carried on. An establishment is also able to maintain records from which it can provide the principal statistics enumerated in the opening paragraph without arbitrary estimation. The main elements are on the input side, total employment measured either in terms of individuals or man-hours or man-days, materials and process supplies used, and fuel and electricity consumed; and on the output side, either production, shipments or sales or revenues received, whichever is appropriate.

Theoretically, an establishment would be engaged in only one kind of activity in one location, but in practice such an ideal establishment is rarely encountered. Thus the unit for which information is usually obtained in statistical surveys is engaged in a number of activities and sometimes these activities take place in different locations. For example, manufacturers of structural steel or tanks usually produce the parts in one location and may erect the structure (bridge or tank) hundreds of miles away from the fabricating plant, thus widening the area of employment not alone to other municipalities but to other provinces as well. This poses quite a problem in the compilation of employment and production statistics on a geographical basis. Where the number of employees engaged in erecting is small the total operation of the establishment is credited to a particular industry and geographically to the municipality where the plant is located. In the case of structural steel and bridge work where the number of employees engaged in erecting is large and where the period of employment on the site extends over a long period, an attempt is made to treat the total operation as two establishments, one being classified to the bridge and structural steel industry and the other to the construction industry. In such cases the employees engaged on the site are considered as employed in construction and not manufacturing.

Some firms are so organized that their activities extend over a number of stages in the production or fabrication of a product which may include extraction or processing of crude materials as well as the fabricating and finishing processes leading to the final product. For example, a gravel or sand pit may be combined with a plant making concrete products or a textile mill may handle processes extending from spinning to weaving, dyeing and finishing of textiles. In these cases, so long as sales of intermediate products do not predominate, the objective of the operation is the final product and a realistic value can be applied only at the point of sale of the final product. Thus, unless records are maintained permitting the isolation of separate establishments for different stages, the whole operation is classified to the industry indicated by the nature of the final product.

The above rule does not apply to manufacturing establishments which sell at wholesale or retail only goods of their own making and which are classed as manufacturers. Many bakeries and dairies are in this category. Theoretically a manufacturing bakery selling its own products should make two reports, one covering its manufacturing operations and the

second covering its merchandising activities. The first report should be classified to manufacturing and the second report to either retail or wholesale trade. In practice the records kept do not permit such a breakdown and in consequence a bakery is treated as a single reporting unit which includes all its operations, manufacturing as well as merchandising. On the other hand, metal mines operated in conjunction with smelting and refining are handled differently. In this case the two kinds of activity are separately classified, the mining operations being classified to mining and the smelting to manufacturing.

With a few exceptions, the annual census of manufactures attempts to cover only the manufacturing operations of an establishment. As mentioned previously few establishments carry on only manufacturing operations. In many cases manufacturers perform the functions of wholesalers in as much as they sell their products direct to retailers or industrial users and not through wholesalers. In some cases, in addition to distributing products of their own manufacture, they also sell products purchased for resale. For the large firms, at least, these two operations which according to the Standard Industrial Classification belong to different industrial classifications, are reported separately in the schedule and only the number of employees engaged in manufacturing as well as the materials and supplies used in manufacturing and the sale of the products actually manufactured by the establishment are credited to manufacturing. The employees engaged in trade or other activities of the establishment as well as the value of sales and cost of goods purchased for resale in the condition in which purchased are excluded from the compilations of manufacturing statistics. In the case of small establishments, however, where only minor quantities of purchased goods are sold, and where the same employees perform both manufacturing and merchandising operations, the establishment is treated as a single unit and all the operations are credited to manufacturing.

Frequently a problem arises whether an establishment is engaged primarily in manufacturing or in trade. The general rule for determining the principal activity of such an establishment is given in the introduction to the Revised DBS Standard Industrial Classification Manual where it is stated:

"In order to determine the principal activity, net values added by its different activities should be used. For example, in the case of manufacturing and trade activity, the data supplied by the establishment should be such that both the 'value added' in manufacturing and the 'gross mark-up' on the commodities purchased for resale can be calculated. 'Value added' consists of the difference between the value of products manufactured in a period and the value of the materials and fuel used in their manufacture. The 'gross mark-up' on purchased goods sold consists of the difference between the cost of such goods and their selling price. The establishment is assigned to one or another activity depending upon which of these is the greater.

On the other hand, for establishments whose activities are confined to one particular division of the classification, the principal activity is determined on the basis of the gross revenue obtained from the different products produced or handled, or services rendered."

At present an establishment engaged mainly in a non-manufacturing activity but which produces manufactured products as a subsidiary operation (for example a country general store which is classified in retail trade and which also produces stock and poultry feeds) is required to make an annual return covering its manufacturing production only. In this connection it is asked to report the number of employees, salaries and wages paid, materials and fuel and electricity used in connection with the manufacturing operations and the selling value of feeds shipped or sold. Many such mixed establishments

find it difficult to make an accurate return since estimates for number of employees, broken down into office employees and production workers, fuel and electricity used, etc., have to be made

Ancillary Units. - Many establishments have ancillary units such as garages, warehouses, power plants, or units making containers or packaging materials which may be housed in the same building as the main establishment or may be separately located. In some cases these ancillary units may also sell part of their products or services to establishments outside their organization. When such an ancillary unit can provide the information required, it is considered to be a separate establishment and is assigned to the industry indicated by the principal activity. When the required records are not available, however, the ancillary unit is assigned along with the main establishment on the basis of the main establishment's principal activity. When an ancillary unit not maintaining the required records is located away from the main plant in another municipality or province an attempt is made to get a separate return on an estimated basis. In all cases where a separate report is required from an ancillary unit, such ancillary unit as well as the main plant are considered as having independent existence, the transfer of products or services from the ancillary unit is treated as a sale and the receipt by the main unit is considered as a purchase of materials or services from other manufacturers.

Head Offices and Regional Offices. - Some firms maintain a head office and in some cases regional offices as well which are separate from the operating establishments. In reporting for a head office, firms are required to report only the number of employees, salaries and wages paid, office supplies and fuel and electricity used. If a firm's records permit, and in most instances they do, the head office or regional offices are treated as separate establishments and are assigned to the industry indicated by the principal activity of the firm as a whole. Some firms straddle main industry divisions, where in addition to manufacturing operations, they also maintain a central selling outlet or several wholesale units in different localities. In such cases, the firm is not considered to be an integrated unit leading to the wholesale activity but is treated as a manufacturing firm, and the head office is assigned to the same industry classification as the manufacturing plant. Where such a firm operates several manufacturing establishments in different industrial classifications, the head office employees and the other items reported are apportioned to the various establishments, usually on the basis of products made or shipped. When a head office or regional office forms part of a particular plant of the firm such a head office is not considered to be a separate establishment but is included in total with the operations of the plant where it is located. In all cases the head office is assigned to the locality where it is situated. If a firm in the pulp and paper industry, for example, had a head office in Montreal and several operating plants in other localities, the head office employees are credited to the pulp and paper industry in Montreal, even though no pulp and paper plants of any kind are located there.

Valuation of Production or Shipments. - For the purpose of calculating "net value of production" or "value added by manufacture" correctly, it is essential that all manufacturers report the value of shipments or of products made on a standard basis, such as for example, on the basis of the price that they would have received from independent wholesalers for the products made or shipped during the year. In practice, however, standardization of selling values is impossible without resorting to difficult methods of estimation, since firms use different channels of distribution. Some firms sell direct to wholesalers while others sell direct to retailers or industrial users and in some cases even sell direct to householders or ultimate consumers. Firms distribute their products in a number of ways. Some ship through a central warehouse which is charged only with the cost of production, the selling outlet being credited with all the profits made. In other cases some of the profit is credited to the manufacturing operation. The value of an identical unit of product reported to the annual census of manufactures thus varies in accordance with the methods of

distribution used. To illustrate, let us assume that it costs one dollar to produce unit "A". Its value as reported could vary approximately as follows:

Shipped to a wholesaler	\$1.10
Shipped to a retail store	\$1.20
Shipped to an ultimate consumer	\$1.50-
Shipped to a central warehouse at cost of pro-	
duction	\$1.00
Shipped to a central warehouse where profits are	
apportioned between manufacturing and selling	\$1.15

The values of shipments or products made as published in the present report are not uniform; they are a composite of different selling values as illustrated in the foregoing paragraph.

Some difficulty has arisen in recording the shipments of multiple unit firms that ship products from various plants to a central warehouse, located apart from any manufacturing plant. where the selling function of the firm is performed. In such cases goods leaving a plant are considered as being shipments under our definition even though the ownership still remains with the reporting firm. Such firms are considered as performing two distinct functions - (a) manufacturing, and (b) distributing and these two functions are treated statistically as if they were performed by two different organizations. In many cases no stock is held at the plant; consequently shipments and production reported on a plant basis are one and the same. We therefore are still getting production figures from firms that sell from a central warehouse. Where the manufactured products are billed to the warehouse, the firm is required to report the total of such billings during the year. In some cases, however, the production and distribution functions are treated in the accounting records as a unified operation with no billing of the warehouse for the products shipped to it. In such cases firms are instructed, if possible, to report the shipments on a cost of production basis, with a percentage mark-up for profits. The aim of the Division is to get companies to report their shipments on the same basis as if they were selling to an independent wholesaler.

Value Added by Manufacture. - Having received a return from all manufacturing establishments and the value of their products totalled, the question now is "What does this total mean?" The truth of the matter is that a total value of production for a group of industries or for all industries in a year has no significant meaning. To add the value of production of flour mills to that of the baking industry would give an inflated value of production since part of the flour which was sold to bakeries is valued twice, first as a product of flour mills and again in the value of bread. For example, if a flour mill produced \$1.00 worth of flour and sold it to a baker, the baker would use this dollar's worth of flour, and after further processing would sell it for \$2.14 according to the experience of the baking industry for 1954. According to the statistics obtained for that year, for every dollar's worth of materials used the products made were valued at \$2.14. When you add the production of these two establishments, you get a value of \$3.14. There is thus duplication where the products of one establishment become the raw materials of another establishment. However, in the present volume, the totals of gross value of production or shipments are shown as a matter of historical interest.

A more meaningful indicator had to be evolved to measure the importance and wealth created by an industry or group of industries. This was found in the concept "value added by manufacture". This figure is obtained by subtracting the cost of fuel and electricity as well as the cost of materials used from the gross value of the products, and represents the values added to the materials while they are in the factory. Such added values constitute the real production of the manufacturing plant and are alone available for the payment of salaries and

¹ To arrive at the National Accounts concept of "gross domestic product at factor cost", it would be necessary to subtract also the cost of office supplies used, advertising, insurance and other goods and services obtained from other businesses. Data on these inputs are not collected on the annual Census of Manufactures. Value added figures for "The primary industries and construction" are published in D.B.S. publication 61-202, Survey of Production.

wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met, as well as profits. The value added by manufacture reported by the various industries can be added to produce a non-duplicating total for manufacturing as a whole. Being free of duplication within the manufacturing sector, value added figures are therefore more representative of the total value of manufacturing production than are gross value of production figures.

The concept of "net value" is also most useful in evaluating the relative importance of different industries as creators of economic wealth. Usually the gross value of production is used in ranking industries but this has the defect of overstating the contribution of industries that use expensive materials on which they perform little processing. The following table ranks the fifteen leading industries in 1954 on the basis of "gross" and "net" value of production.

	Selling v factory sh		Value added by manufacture		
	Amount	Rank	Amount	Rank	
	\$'000,000		\$'000,000		
oulp and paper	1,241.6	1	641.1	1	
Non-ferrous metal smelting and refining	922.6	2	352.0	2	
Petroleum products	909.3	3	309, 8	3	
Slaughtering and meat packing	837.5	4	157.7	9	
Motor vehicles	666.3	5	176.5	8	
awmills	572, 2	6	263.6	4	
Sutter and cheese	412.2	7	99.4	24	
Primary iron and steel	383. 2	8	217.5	5

Railway rolling stock	283.4	11	116.7	18	
Bread and other bakery products	280, 2	12	139.9	14	
liscellaneous electrical apparatus and supplies	267.6	13	145.6	13	
Subber goods (including footwear,	264. 2	14	149.0	10	
Printing and publishing	256, 7	15	182, 9	6	

On the basis of the various factors involved in determining an establishment, outlined in the preceding paragraphs, the definition of a manufacturing establishment may be summarized as follows:

The Establishments. — In most cases an establishment is a complete factory. Sometimes, however, a plant is divided into two or more establishments when it carries out operations classifiable to different industries and when separate accounting records are available. Usually the statistics for an establishment relate only to the manufacturing activities. Other activities such as construction at the plant by its own employees, wholesale or retail activities carried on at the plant location, are not included, Plants engaged solely in repair work (except in the case of furniture, shipbuilding, boat building, aircraft and railway rolling stock industries) are not included, but plants occupied in assembling parts into complete units are included. Data for the annual census is collected on an establishment basis and in most cases a firm with more than one plant is required to file a report for each plant.

Period Covered. — Firms are asked to submit figures for the calendar year, if at all possible, and most report on that basis. Financial year reports, for periods differing from the calendar year, are accepted in instances where the firms find it impossible to supply calendar year data from accounting records. However the data on employees, salaries and wages are requested on a calendar year basis in all cases.

Employees. — Administrative and office employees include all executives and supervisory officials such as presidents, vice-presidents, secretaries, treasurers, together with managers, professional and technical employees, superintendents and factory supervisors above the working foremen level and clerical employees. Working owners and partners are also included in this category. The number reported is the average for the year,

Production and related workers include all other factory workmen whether paid on a monthly, weekly, hourly or piecework basis. Working foremen doing work similar to that of the employees they supervise are included, as are maintenance, warehousing and delivery staffs. Employees on new construction work, in retail or wholesale operations, on outside piece work etc., are not included.

Production workers are reported by months, an average for the year being obtained by summing the monthly figures and dividing by twelve. This procedure is followed even though the plant did not operate in all months. Figures on employment refer to calendar years whether or not some establishments reported other data on a financial year basis.

Salaries and Wages. — Salaries and wages refer to gross earnings of the employees described above, including salaries, wages, commissions, bonuses, the value of room and board where provided, deductions for income tax and social services such as sickness and unemployment insurance, pensions, etc., as well as any other allowances forming part of the employees' wages. Payments for overtime are included.

Salaries refer to amounts paid to administrative and office employees. Withdrawals by working owners or partners for normal living expenses for self and family are included but not their withdrawals for income tax. Wages refer to the amounts paid to production and related workers as defined above. Data on earnings refer to the calendar year whether or not some establishments reported other data on a financial year basis.

Cost of Fuel and Electricity. — Figures for fuel refer to amounts actually used, (including fuel used in cars and trucks), not to purchases, unless the quantities are the same. Values refer to the laid-down cost at the works, including freight, duty, etc. When the rental paid includes heat and light, the value of fuel and electricity used is not reported.

Materials and Supplies Used. — Figures represent quantities and laid-down cost values, at the works, of materials and supplies actually used during the year whether purchased from others or received as transfers from other plants of the reporting company. Amounts paid to other manufacturers for work done on materials owned by the reporting company are included. Returnable containers or any other items charged to capital account are not included. Fuels are not included. Goods bought from others

or received as transfers from other plants of reporting companies for resale without further processing are not included. Maintenance and repair supplies not chargeable to capital account are included.

Factory Shipments. — Factory shipments refer to shipments of goods made from own materials either in the reporting plant or by other manufacturers on the basis of a charge to the reporting plant for work done. All products and by-products shipped from the establishment are included whether for domestic use, export, or for government departments. Transfer shipments to sales outlets, distributing warehouses or to other manufacturing units of the reporting firm are included. Goods bought or received as transfers and resold without further processing are not included. Values are computed on f.o.b. plant or plant warehouse basis, and do not include sales tax or excise duties. Values of containers not returnable are included. Amounts received in payment for work done on materials owned by others are included.

In a few industries such as shipbuilding, aircraft, etc., where work on principal products extend over a relatively

long period, the value of production is recorded rather than the value of shipments. For those industries production is computed from the value of deliveries of complete units during the year plus the value of work done during the year on unfinished units less the value of work done in previous years on finished units delivered in the year under review.

Inventories. — Values represent the book values of manufacturing inventories owned and held at the reporting plant. Figures include inventories held in warehouses or selling outlets which have been included with plant operations for purposes of reporting shipments.

Standard Industrial Classification. — The Standard Industrial Classification Manual, prepared by the Dominion Bureau of Statistics, provides for 135 three-digit industries in the manufacturing sector, arranged in 17 major groups. Reporting establishments are classified or allotted to specific industries on the basis of the value of principal products made or shipped. Some of the three-digit industries are further broken down into smaller industries at a four-digit level. At this level there are 169 distinct industries for which principal statistics are given in Table 11.

Subsection 2. Recent Changes in Methods

Three important changes have been made during the past few years in the methods of collecting and compiling the returns of the annual survey of manufactures. First was the adoption in 1949 of the Standard Industrial Classification. This new classification superseded the classification formerly used by the Bureau, which was based on the nature of the materials used by manufacturing establishments.

For most purposes, a classification of manufacturing industries based upon "chief component material" has in the past proved most useful in Canadian industrial classification. The Bureau's classification based on this concept has been the one most widely adopted for general purposes, such as the decennial census, foreign trade, industrial statistics, etc. Even for these purposes some modification has been deemed expedient, such as the inclusion of such a group as "Textile Products" comprised partly of animal and partly of vegetable products.

When the industry of a country is primarily concerned with the early stages in the processing of primary materials, which form final products such as pig iron, lumber or processed fish, a classification based upon chief component material is wholly applicable. As manufacturing industry develops, however, turning out more and more goods for final consumption, the combination of ingredients in such production becomes more and more complex. The modern automotive, aircraft, shipbuilding and electrical apparatus industries are examples in which a wide variety of materials must be assembled for the compilation of the final product. For this reason, the application of the component material classification became increasingly more difficult as Canadian manufacturing production developed and diversified.

In establishing the Standard Industrial Classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. For the classification of consumers' goods industries, the concept of "purpose" seems most applicable both in terms of common usage in referring to industries and in providing the type of data most often required. Hence, such major groups as Foods and Beverages. Clothing, Transportation Equipment, Electrical Apparatus and Supplies, have been established. Some industries were broken down, such as the electrical apparatus and supplies which now comprises five industries - (a) batteries. (b) heavy electrical machinery, (c) radios, television sets and parts, (d) refrigerators, vacuum cleaners and appliances, and (e) miscellaneous electrical products. In some cases, establishments were transferred from one industry to another in order to bring them in line with the new industries which were established. Where an industry was eliminated, the establishments were transferred

to one or several industries, depending on the nature of the principal products manufactured. A check was also made of all establishments and many transfers were made where the major products of the establishment had changed materially during the years. By and large, little change was required for most industries, the only change being a transfer to the new major groups which were established.

In the Standard Classification adopted in 1949 the industries are now grouped into seventeen major groups listed in Table 11, instead of the nine groups listed in Table 13 which were formerly used as the main basis of classification. The grouping used in Table 11, where the statistics of individual industries are presented in detail, and in the historical series shown in Table 3 is, therefore, on the basis of the new Standard Industrial Classification. However, to retain some basis of continuity with the past, there is a less detailed analysis given in Table 13 on the component material classification basis, while Table 14 gives the industries on the basis of the origin of the materials used.

The second major change was the adoption of the short form in 1949, which goes a long way in relieving small manufacturers from the irksome duty of filling in complicated and detailed returns to the Bureau.

The growing complexity of modern economic life compels governments to obtain more and more data on which to base their economic policies and for the efficient discharge of their responsibilities in the ever-widening field of activity. To get this information is expensive and also throws a burden on industry in general, which of necessity must be called upon to furnish the desired data. Realizing this, and also the fact that the necessary information must be secured, the Bureau has been casting about for new statistical techniques which would lessen the burden on industry and also would, at the same time, secure substantially correct data for the use of the administrator. With manufacturing statistics, unfortunately, the sampling techniques are difficult to apply. Other methods, therefore, had to be adopted in order to lessen the burden of the smaller manufacturer at least and, at the same time, secure substantially correct results. It was found, for example, that in 1949 out of 35,792 manufacturing establishments, 21,060 with a value of production of \$50,000 or less, contributed only 2.6 p.c. of the total value of production. On the surface it looked obvious that the Bureau could exempt these 21,000 establishments from making annual returns and still obtain satisfactory results. This would be true if we were only interested in the total value of production or the total value of materials used. This, however, is not the case, as the users of the statistics are also interested in the details of the products made and the materials used. By a study of each industry it was

found that by exempting the smaller establishments in some industries, that for some commodities produced or materials used there would be a 50 p.c. loss of the total Complete exemption was therefore out of the question. New methods had to be designed to relieve small establishments of the difficult task in furnishing information. A study was therefore made of each industry classification, of which there are about 200, and different cut-off points were determined for different industries. The general rule adopted was that wherever possible establishments with a value of production of less than \$50,000 per annum should only be required to furnish that one figure to the Bureau. and that on the basis of the information received from the smaller establishments in 1948, the last year for which they were required to furnish complete details, the Bureau would estimate for each small establishment individually the number of employees, salaries and wages paid, as well as the value of materials used. This is done in order to have a hollerith card for each establishment to use in the compilations on a geographical basis. In addition to the principal statistics. details of materials used and products made by the short-form firms are also made for each industry, by province. These estimates are based on the detailed statistics supplied by the small establishments in 1948. These estimates cannot be far out, as in most industries the percentage that these smaller establishments contribute to the total for the industry is only from 10 to 20 p.c. Where it was found that there would be a great loss in commodity data, instead of asking only for the gross value of production, the smaller firms were required to fill in a shorter form which lists the commodities in which there would be a substantial loss if no information was obtained from small firms. In other cases the cut-off point was reduced to \$25,000 or \$15,000.

An important change was made in the annual census of manufactures for 1952. A shipments concept instead of the value of production statistics heretofore compiled was adopted for a large number of industries where it was known that inventory changes from year to year were only of a minor nature. The concept was not changed for industries known to experience wide fluctuations in inventory holdings, pending further study for the need of both production and shipments information. By 1954 the shipments concept was implemented for almost all industries. Industries for which production statistics are still required are asked to report the detail of products made in physical quantities only and at the same time are required to report details of their shipments, giving both the quantity as well as the selling values at the plant. In a few industries such as sawmills, veneer and plywood, etc., production statistics only are still collected, the products made being valued on the basis of average selling prices during the current year.

The aim of the new Census of Industry schedule is to ease the burden of filling out Bureau questionnaires. The value of shipments concept for small and medium sized establishments is more realistic and more readily obtainable from the accounting records of firms, whereas the value of products made, for firms not recording such information, must be derived from special calculations. The value of shipments provides a standard basis of reporting for all establishments. Under the old system some establishments reported the value of products made and others the value of factory shipments, even though the schedule required products made to be reported. This was

especially true for small and medium sized establishments. Further, a great number of firms, attempting to report production values to fulfil the requirements of the old questionnaire, in fact computed their cost of production rather than their selling value, as they were supposed to. Since the value of shipments is usually carried in the firm's accounts, the work of filling out reports should be lessened and the questionnaire should as a result be filled out more promptly. The change should ease the burden for small establishments in particular, since the value of sales is readily available from their accounting records.

Under the "value of products" concept, establishments were required to report the factory selling value of the products made, whether sold or not, the unsold portion being assigned the average selling value of similar articles sold during the year. Where no selling values were available for the unsold portion estimated values had to be assigned. Under the new concept establishments are required to report their sales during the year, regardless of when the products were made.

These two concepts give different results, the first gives the value of products made and the second the value of products sold. For a large number of industries where normally there is no significant changes in the opening and closing inventories of finished products, these two sets of figures may be used interchangeably as they both reveal more or less the value of production and are, therefore, comparable with figures for previous years. There are, however, a number of large key industries with substantial changes in their opening and closing inventories. In such industries the new concept gives quite different results to that obtained formerly. To get comparable figures, the shipments figures must be converted to a production basis by adjusting for inventory change.

The change to the new concept solved the problem of uniformity of reporting inasmuch as the smaller firms who previously were reporting shipments instead of production are now reporting correctly. However, the new method has created other problems. One of these is the calculation of "value added by manufacture," which is obtained by subtracting from the value of production the cost of materials used, including the cost of fuel and electricity. Since the value of production is not now being reported, it has to be calculated by using the following formula.

"Shipments plus closing inventory of finished products and goods in process minus the opening inventory of finished products and goods in process equals value of products made."

In order to enable the Bureau to calculate "value added," it became necessary to ask firms to report their opening and closing inventories, broken down into (a) raw materials, (b) goods in process, and (c) finished products. These questions were added to the form for the 1954 census. As the schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added by manufacture is obtained by subtracting from the shipments the cost of materials used, including fuel and electricity. Ideally the inventory adjustment should be on a "value of the physical change" basis rather than the "change in book value". However, it has not been possible to introduce these refinements at the present time.

Subsection 3. General Review of the Manufacturing Industries of Canada, 1957

In spite of a downturn in production in the fall of the year, the manufacturing industries of Canada in 1957 established new record highs in number of employees, salaries and wages paid and the selling value of factory shipments. Shipments at \$22,183,594,311 were the highest on record and exceeded by 2.5 per cent the high mark attained the previous year. In employment, the record was not so impressive. Although there was an increase of 0.4 per cent in the number employed in 1957 as compared with 1956, the number still was only 31,610 higher than the record number employed in 1953. Salaries and wages paid at \$4,819,627,999 and value added by manufacture at \$9,822,084,726 were the highest on record, exceeding the previous high of 1956 by substantial margins. The physical output of manufactured products, however, declined 1.8 per cent

in spite of the fact that the number of employees was 0.4 per cent higher. A drop of about 2 per cent in the average number of hours worked per week in 1957 contributed to this result.

The physical volume of production in 1957 was down 1.8 per cent from the record level of the previous year, while the selling value of factory shipments was 2.5 per cent higher. This is more or less accounted for by an increase in the wholesale prices of partly and fully manufactured goods. In spite of the minor downturn in production, the output of non-durable goods continued to expand and recorded a minor increase of 0.9 per cent. The production of durable goods on the other hand recorded a decline of 4.6 per cent, which resulted in a net decline of 1.8 per cent for manufacturing as a whole. The total

index for manufacturing in 1957 stood at 142.5. For non-durable goods it was 139.3 and for durable goods 146.2. Since the end of the war the durable goods sector experienced an almost uninterrupted expansion in volume of production, the only exception being 1954 and 1957 when the output was lower than the previous year. Non-durable goods industries fared better, having experienced only one year of lower output, viz. 1954. In spite of the steadier expansion, the non-durable goods sector recorded an increase in volume of only 54 per cent between 1946 and 1956 while durable goods increased by 92 per cent during the same period.

In the non-durable goods sector the trend in physical output in 1957 was mixed, with the majority of the industrial groups reporting higher output. The greatest gain in volume of production of 10.3 per cent as compared with 1956 was reported by the tobacco and tobacco products group. This was followed by miscellaneous industries with an increase of 4.3 per cent. chemicals and allied products 3.8 per cent, beverages 3.5 per cent, products of petroleum and coal 3.4 per cent, foods 1.4 per cent, and printing, publishing and allied industries 0.7 per cent. Four groups reported declines in volume. Rubber and rubber products reported a drop of 4.0 per cent; clothing, including knitting mills, 2.0 per cent; paper products 1.7 per cent; and textiles 0.3 per cent. The leather products group which has experienced a long-term downward trend reported no change in 1957. This compares with an increase of 8.2 per cent the previous year.

In the durable goods sector, all groups, with the exception of non-metallic mineral products, reported lower levels of production. The greatest decline of 9.5 per cent was reported by the wood products group, followed by electrical apparatus and supplies with 5.1 per cent; transportation equipment 4.6 per cent; iron and steel products 3.9 per cent; and non-ferrous metal products 3.3 per cent. The non-metallic mineral products group which produces mainly building materials managed to come up with a minor increase of 0.9 per cent. This result is a reflection of the high level at which the construction industry operated, in spite of the general slackening in economic activity. The wood products group which also produces building materials on the other hand reported a substantial decline in physical output. This was due mainly to the continuing decline in exports. Planks and boards dropped from 3,936,161 M feet in 1956 to 3,635,497 M feet in 1957; red cedar shingles from 1,959,352 roofing squares to 1,718,203 roofing squares, and veneer and plywood from 738,158 M square feet to 490,750 M square feet. Not all industries in the transportation group were affected by the general slowing down in production. The motor vehicle industry with a drop of 12 per cent in volume was the most severely affected, the number of motor vehicles produced dropping from 471,350 in 1956 to 413,577 in 1957. The motor vehicle parts industry was also affected to the extent of a 10 per cent decline in output. Aircraft and shipbuilding on the other hand operated at higher levels, posting increases of 12 per cent and 7 per cent respectively. Railway rolling stock with an increase of 0.9 per cent was also slightly higher.

The high level at which the manufacturing industries of Canada operated during 1957 was the result of two main factors. First was the continuing high spending on capital goods, such as construction and machinery and equipment of all kinds which rose from \$8,036,000,000 in 1956 to \$8,717,000,000 in 1957, an increase of 8 per cent. Construction was up by \$511,000,000 while expenditures for machinery and equipment were \$170,000,000 higher. This stimulated some of the durable goods industries to a marked degree. The hydraulic cement industry had a 20.6 per cent increase in volume of production, the output of cement rising from 5,021,683 tons in 1956 to 6,049,098 tons in 1957. Bridge-building and structural steel was also 15.8 per cent higher, while heavy electrical machinery as well as industrial machinery and machine tools recorded but minor gains in output. The output of the primary iron and steel industry dropped 5.9 per cent. The production of pig iron at 3,718,350 tons was 150,147 tons higher while steel ingots and castings at 5,068,149 tons were 233,053 tons lower. The second factor was the impact on the consumer goods industries of the increase of about 543,000 in population as well as by the continued rise in labour income.

The decline in the export demand for Canadian manufactured products was an important factor adversely affecting manufacturing operations in 1957. As mentioned previously there was a marked decline in the export of planks and boards, shingles, veneer and plywood. Wood pulp, newsprint, whisky, wheat flour, aluminum and products, copper and products, zinc, automobiles and parts, fertilizers, and aircraft were all lower. There were, however, increases in the export of farm implements and machinery, nickel, artificial crude abrasives, non-farm machinery and synthetic plastics and their manufactures.

Ontario which is now recognized as one of the world's major industrial areas, accounts for approximately half of Canada's manufacturing production. Despite the great industrial progress made by other provinces, Ontario continues to maintain its predominance, and in 1957 accounted for 49.9 p.c. of the total value of factory shipments. Quebec with 30.1 p.c. of the total shipments ranks as the second largest industrial province, while British Columbia with 8.0 p.c. of the total ranks third. In 1957 Ontario increased its share of the total while Quebec and British Columbia reported minor declines.

The slightly increased activity reported by the manufacturing industries of Canada during 1957 was not uniformly felt throughout the country. From the point of view of numbers employed, British Columbia with a drop of 2.7 per cent experienced the first set-back in manufacturing employment which expanded uninterruptedly during the past few years. The biggest decline in employment was, however, reported by New Brunswick with a drop of 7.0 per cent. This was followed by Prince Edward Island with a drop of 6.3 per cent, British Columbia 2.7 per cent and Newfoundland 0.4 per cent. All the other provinces reported increased employment. Alberta with an increase of 6.2 per cent headed the list, followed by Saskatchewan with 4.1 per cent, Manitoba 2.5 per cent, Nova Scotia 1.9 per cent, Quebec 0.7 per cent, and Ontario 0.5 per cent. For Canada as a whole, the increase in employment was 0.4 per cent.

The industrial expansion of Canada since Confederation has been phenomenal. In the past generation alone, Canada has changed from a country producing and exporting mainly primary products to a country that is increasingly producing and exporting manufactured products, until to-day manufactures account for about 30 p.c. of the value of all goods and services produced, and also rank as the leading employer of labour in Canada.

Canada is no longer on the fringes of industrialization but ranks among the world's most important manufacturing countries. Basic historical developments, such as the opening of the West and the magnitude of requirements of all kinds for World Wars I and II, have been followed by recent discoveries of far-reaching significance. Such events as the discovery of a major oil pool on the prairies in 1947, the discovery of large-scale deposits of iron and the successful search for uranium have given new dimensions to Canadian thinking and business planning. These are the factors that explain the records of capital expenditures year by year since the end of the War. Yet it is not the mere rate of expansion that is significant. There have been other periods when Canada's population has grown more rapidly and in many respects the rate of industrial expansion in the late 1920's was relatively as great as in the post-war years. The real significance of the latter period is that never before has there been an advance on such a broad industrial front.

The second point to be observed is the changing emphasis of Canadian manufacturing activity. By 1949 the period of post-war conversion was passed and Canada had entered a new phase of economic expansion which derived its dynamic from the discovery of new resources and the application of new processes. This meant that even the sharp recession in the United States in the year 1949 failed to have significant effects in Canada. The influence of Korea and the consequent rearmment program gave an added impetus to the expansion of Canadian industry and to the development of Canadian basic resources. Capital expenditures that contributed most to the defence of Canada were given priority. Additional capacity was created to meet requirements of the specialized defence

program—aircraft, electronic equipment, ships and guns—many items of which had never before been produced in Canada. Measures such as steel control, credit regulations and deferred depreciation had the desired effect. A shift gradually took place toward the further expansion of basic industrial capacity and away from investment in consumer goods and services.

The stability of current levels of manufacturing is indicated by the fact that such activity is the result of business assessments of resources and market potentialities. Millions of dollars are being invested in oil because the prairies can produce oil as economically as other great fields on the North American Continent. Petro-chemical plants are being erected because the raw materials are readily at hand. Kitimat is based on the coincidence of abundant and cheap hydro-power and access to ocean transportation, both of which are essential to the low-cost production of aluminum. The exploitation of the Ungava iron deposits rests on the belief that the steel industry of the North American Continent will need the high-grade ores involved in order to meet continuing peace-time demands. No country is in a more favourable position than Canada to supply uranium for the production of atomic energy.

Of strategic importance, and probably of even greater long-term significance to the Canadian economy, has been the growing world-wide shortage of raw materials; a shortage born of rising levels of employment and income, and accentuated by the course of international events, especially since 1950. These demands have shown few signs of abating and they have led to substantial increases in Canadian primary manufacturing capacity, particularly in so far as the light metals, nickel, chemical fertilizers and the cheaper grades of paper are concerned.

In recent years the demands stemming from population growth and a rising standard of living have been noticeable at all levels. In food processing, a steady up-grading in the quality of foods sold on the domestic market has been even more important than population growth. The two together have almost doubled the dollar sales of processed foods in this country since 1945. And at the intermediate level other important changes have taken place. Many of Canada's new chemical plants, for example, have been built with the domestic consumer market in mind. Frequently using petroleum or natural gas as a source of raw material, they have gone a long way towards making Canada independent of imports in such categories as vanillin, nylon and rayon intermediates, and plastics for packaging and similar uses.

The tremendous development which has taken place in Canada during the decade preceding 1957 is strikingly illustrated by the increase of 50.6 p.c. in the physical volume of manufactured products between 1946 and 1956 as compared with an increase of only 31 p.c. in the population. Part of this increase, resulted from an increased demand abroad for Canadian manufactured goods, part to the demands imposed on Canadian industry as a result of the expansion in the economy during the past decade, and part to the increase in the standard of living of the Canadian people. The increase of 70.1 p.c. in the output of durable goods consisting mainly of building materials, transportation equipment as well as machinery and equipment of all kinds reveals the extent of the contribution made by Canadian industry to the phenomenal expansion in the productive capacity of the country. Non-durable goods during the same period increased by 36.3 p.c. Although this increase is quite large it is, nevertheless, overshadowed by the much larger increase of 70.1 p.c. in the durable goods industries of the manufacturing sector.

With only one exception, all groups in both the durable and non-durable sectors recorded marked advances in volume output since 1946, the exception being leather products with a decline of 11.9 p.c. In the durable goods sector the most striking advance was made by the non-metallic mineral products group with an increase of 137.5 p.c. This was followed by electrical apparatus and supplies with 122.5 p.c., non-ferrous metal products 78.5 p.c., transportation equipment 67.9 p.c., iron and steel products 47.3 p.c. and wood products 46.6 p.c.

In the non-durable goods sector the greatest advance was achieved by the products of petroleum and coal group with 164.3 p.c. This was the highest increase of any group of either

sector. Rubber and rubber products with an increase of 101.6 p.c. came second, followed by printing, publishing and allied industries with 64.7 p.c., beverages 60.6 p.c., tobacco and tobacco products 59.2 p.c., paper products 48.1 p.c., chemicals and allied products 26.5 p.c., foods 15.9 p.c., textiles 12.8 p.c., and clothing 2.0 p.c. The output of the leather products group declined by 11.9 p.c.

Manufacturing establishments reporting in 1957 numbered 37,875. Of these 916 were located in Newfoundland, 193 in Prince Edward Island, 1,356 in Nova Scotla, 981 in New Brunswick, 12,250 in Quebec, 13,580 in Ontario, 1,590 in Manitoba, 844 in Saskatchewan, 1,893 in Alberta, 4,250 in British Columbia and 22 in the Yukon and Northwest Territories. These plants furnished employment to 1,359,061 persons who received \$4,819,627,999 in salaries and wages. They also shipped goods with a selling value at the factory of \$22,183,594,311 and spent \$11,900,751,703 for materials, while the value added by manufacture totalled \$9,822,084,726.

The value added is obtained by subtracting the cost of materials, including fuel and electricity, from the gross value of products. The difference represents the value added to the materials by labour. It is this difference which the employer of labour uses to pay for the labour itself, the overhead expenses, interest and profits.

To calculate the value of production, it is necessary to adjust the value of shipments for the difference in the opening and closing inventories of finished goods and goods in process. As the census of industry schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added is obtained by subtracting from the shipments the cost of materials, including fuel and electricity. The value thus obtained is somewhat different to the actual value. Beginning with 1954 it is again possible to obtain value of production figures, by adding to the value of shipments the changes in the inventory of finished products and goods in process. The figures for value added in 1954 and subsequent years are, therefore, comparable with 1951 and prior years

A number of industries still report value of production. To calculate value added by manufacture for these industries, the value of materials used, including the cost of fuel and electricity, is subtracted from the value of production reported, no account is taken of inventory change. For this reason the figures on value added by manufacture for manufacturing as a whole or for major groups published in this report differ slightly from the calculated figures derived by using the formula for converting shipments to production values which is "Shipments plus closing minus opening inventories of finished goods and goods in process equals value of production". To illustrate this point 1955 figures for Canada will be used. These figures are as follows:

	\$'000,000
Value of factory shipments	19,513.9
Inventory of finished goods and goods in process: Closing Opening	
Cost of materials used	10,338.2
Cost of fuel and electricity	457.8
Calculated value of production (19,513.9 plus 1,738.6 minus 1,619.7 = 19,632.8)	

This is slightly different to the 8,753.5 figure given in Table 1. The difference is due to the fact that the figures for inventory change used in the formula are for manufacturing as a whole and include the figures for those industries still on a production basis and for which inventory changes have not been taken into account in calculating their value added by manufacture.

(19.632.8 minus 10.338.2 minus 457.8 = 8.836.8)

Value added by manufacture

Percentage Variation in Volume of Production, 1946-57

	Volume	e index (1949 =	100)	Percentage variation		
Group	1957	1956	Percentage variation	1951 compared with 1946	1956 compared with 1951	1956 compared with 1946

Tables 1 to 3 give a picture of the growth of manufacturing, in general, as shown by comparable principal statistics, i.e., establishments, capital, employees, salaries and wages paid.

cost of materials and values of products. A number of interesting comparisons are made in Table 4 and figures of consumption are given in Table 6.

TABLE 1. Summary Statistics of Manufactures, 1917-57

Note: Statistics of manufacturing from 1870 have been published, but between that year and 1917 they are not on a comparable basis to the series given below. They will be found in Table 1 in the 1941 edition of this report. Statistics of the non-ferrous metal smelting industries were not included in manufactures for the years 1920-1924.

included in manufactures for the	years 1920	- 1924.					adouted word not

¹ Years 1924-51, inclusive, the "Value added by manufacture" is computed by subtracting the cost of fuel, electricity and materials from the gross value of products. Years 1952 and 1953 the deduction is made from "Value of factory shipments" and in 1954 and subsequent years from the calculated value of production. Figures prior to 1924 are not comparable since statistics for cost of electricity are not available. (See text on Concepts p. 10).
¹ In 1952 and subsequent years the basis of collection is "Value of factory shipments" instead of "Gross value of products."

for this province and therefore not included.

cepts p. 10).

In 1952 and subsequent years the basis of collection is "Value of factory shipments" instead of "Gross value of products."

A change in the method of computing the number of wage-earners in the years, 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931, however, the method in force prior to 1925 was re-adopted.

Newfoundland is included for 1949 and subsequent years, however, figures for the fish processing industry, 1949 and 1950, are not available for this province and therefore not included.

TABLE 2. Summary Statistics of Manufactures, by Provinces, Significant Years, 1917-57

Province and year	Estah- lish- ments	Capital	Em- ployees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Gross value of products ¹

¹ In 1952 and subsequent years the basis of collection is "Selling value of factory shipments" instead of "Gross value of products".

¹ Includes for the first time the fish processing industry.

³ A change in method of computing the number of wage-earners in the years 1925 to 1930 inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931 the method in force prior to 1925 was re-adopted.

⁴ Includes Yukon and Northwest Territories.

Significant Changes in Manufacturing Production. - The figures in Table 4 trace the tendencies in Canadian manufacturing industries as clearly as possible from 1917 to 1957. In analysing statistics of production and materials used, price changes should be borne in mind, particularly the inflation of values in the years immediately following World War I, the drop in prices of commodities during the depressions following 1921 and 1930, and the increases again in the recent war and post-war period. The figure that shows most clearly the trend of development is concerned with the use of power. The total horse-power employed increased from 1,658,475 in 1917 to 10,397,703 in 1953, an advance of about 527 p.c. in 37 years. In the same period, horse-power per production employee showed an uninterrupted trend from 3.06 to 10.82 in 1933 and 9.46 in 1939. With the large increase in the number of production employees on war production, and the more efficient utilization of the equipment available, the horse-power per production employee dropped to 6.28 in 1944; the increasing installation of power machinery and the decline in employment after the war resulted in a rise to 8.52 in 1948 and 9.87 in 1953. The significant feature is the increase in both the absolute figures of power employed and the averages per production employee during the depression years as compared with 1929, although the large numbers of persons again finding employment since 1933 reduced the averages for the years 1934 to 1937 and again for 1940 to 1945. Other interesting comparisons are the trend of value added by manufacture, per employee, and of average earnings since 1929. Between 1949 and 1957 the value of purchased fuel and electricity increased by 81.6 per cent; for full details of fuel and electricity used by the manufacturing industries see Tables 57 and 58

¹ In 1952 the basis of collection was changed from "value of products made" to "selling value of factory shipments".
² Increase is due to the inclusion for the first time of establishments that publish periodicals without doing any printing.
³ There were three major changes in concept affecting the data for the Primary Iron and Steel Industry in 1954. The first one involved a change in the method of counting establishments; the second concerned a change in valuing shipments of wire rods transferred to makers' own processing plants; while the third concerned the method of calculating "value added by manufacture". Figures for 1954 and subsequent years are therefore not comparable with previous years. See footnotes to Table 2 of the 1954 report on the Primary Iron and Steel Industry. but the major factor contributing to this increase was a change in accounting procedure by some firms of the procleum products industry in calculating value of factory shipments. This increase was a change in accounting procedure by some firms of the procleum products industry in calculating value of factory shipments. This increase was a change in accounting procedure by some firms of the procleum products industry in calculating value of factory shipments.

	203	227	3	273 ⁵
	9,46	6,28	3	9,87 ⁵

A change in the method of computing the number of production workers in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. There was, therefore, a proportionate reduction in the averages for 1925-30 per employee as compared with what these averages would have been under the other method. In 1931, however, the method in force prior to 1925 was re-adopted. The figures for 1931 and for later years are therefore comparable with those for 1924 and earlier years.

See footnote 1, Table 1.
Collected only every five years.
See footnote 2, Table 1.

Recent Changes in Manufacturing Production. - Table 5 shows the changes in the nature of manufacturing production since the end of World War II with regard to numbers employed, the salaries and wages paid, and the gross value of products. Owing to price declines during depressions and rises during periods of prosperity, the values of both wages and products are naturally affected more than the number of employees. Furthermore, during periods of curtailed production there is a tendency for production workers to be put on part time, while the number of office employees responds less quickly to reduction in output than that of production workers. Therefore, there are several reasons why the variation in number of employees should be less than that of money values. The

figures of Table 5 are to be compared with those of Tables 8, 9 and 10 which show changes in volume of production. The number of employees in 1944 increased by 86 p.c. over 1939. Salaries and wages paid were 175 p.c. higher and the gross value of production 161 p.c. higher. Another significant change is the increase in the proportion of women engaged in manufacturing. Whereas in 1939, there were 281 females to every 1,000 males employed, in 1944 this figure jumped to 403.

Significant changes in the nature of manufacturing production took place after the cessation of hostilities in 1945. Industries engaged in war production operated at a substantially lower level, while industries producing consumer goods stepped

These figures are for 1953 which is the latest year available.

up their production. From the point of view of employment the chemical and allied products group with a drop of 33 p.c. experienced the greatest decline in production between 1945 and 1949. Transportation equipment which includes aircraft and shipbuilding was second with a drop of 32 p.c., followed by tobacco and tobacco products with 12 p.c., rubber goods 12 p.c. and iron and steel products 3 p.c. The non-metallic mineral products group reported the greatest gain in employment with an increase of 39 p.c., followed by printing, publishing and allied trades 31 p.c., wood products 29 p.c., electrical apparatus and supplies 27 p.c., products of petroleum and coal 26 p.c., paper products 21 p.c., textiles (except clothing) 19 p.c., clothing (textile and fur) 18 p.c., foods and beverages 8 p.c., leather products 2 p.c. and non ferrous metal products 1 p.c. For manufacturing as a whole there was an increase of 4 p.c. in the number of employees with an increase of 39 p.c. in the amount of salaries and wages paid. Although there was an increase of 50 p.c. in the gross value of production, the increase in the physical volume was only 7.6 p.c. This is due to the rise in the wholesale prices of fully and partly manufactured products.

Between 1949 and 1954, for manufacturing as a whole, there was an increase of 40.6 p.c. in the gross value of production, 8.1 p.c. in employment, and 75.5 p.c. in salaries and wages paid. In terms of employment, the electrical apparatus and supplies group with an increase of 34.3 p.c. experienced the greatest expansion since 1949. Transportation equipment came second with 27.4 p.c., followed by non-metallic mineral products with 25.2, chemicals and allied products 24.9, products of petroleum and coal 20.7, miscellaneous industries 17.7 paper products 14.3, non-ferrous metal products 13.0, and printing, publishing and allied industries 11.0. The smallest gain was reported by the rubber products group with 0.8 p.c. Four groups reported declines in employment. Textiles led the list with a drop of 17.0 p.c., followed by leather products with 11.9, tobacco and tobacco products 11.4 and clothing 5.5.

Significant changes have also occurred regionally between 1949 and 1954. In terms of employment, there was an increase of 8.1 p.c. for Canada as a whole. With the exception of two provinces, New Brunswick and Manitoba, all other provinces reported increased employment in manufacturing. Alberta led in this respect with an increase of 24.0 p.c., followed by British Columbia with 15.6 p.c., Newfoundland 13.2 p.c. and Quebec 8.7 p.c. These four provinces were above the Canadian average of 8.1 p.c. Four other provinces also reported increases in employment, but below the Canadian average. Of these Ontario reported an increase of 7.5 p.c., Saskatchewan 6.3 p.c., Prince Edward Island 1.5 p.c. and Nova Scotia 1.0 p.c. Of the two provinces reporting declines New Brunswick suffered a drop of 5.7 p.c. and Manitoba a drop of 1.7 p.c The following table gives the changes which have taken place in manufacturing during the past ten years, on an industrial as well as a geographical basis.

* Exclusive of "Publishing (only) of Periodicals" in columns 1, 2 and 3.

* Due to the changes of establishments from one industry to another figures for 1949 are not comparable with previous years.

Consumption of Manufactured Products. - One of the beneficial results of adopting the same classification for external trade and for production is exhibited in Table 6, where the value of commodities made available for consumption in Canada is derived from these statistics. For example, the value of all manufactured commodities made available in 1957 was \$23,458,088,464, a figure obtained by adding to the value of manufactured products the value of the imports of manufactured and partly manufactured goods and deducting the value of the exports. In this table more accurate statistics could be presented were it possible to exclude from the gross value of manufactured products the duplications involved when the products of one manufacturing establishment become the material worked upon in another. Iron, vegetable, wood and paper, non-ferrous metals, non-metallic minerals, animal and textile products were, in that order, the leading groups in the value of finished products made available for consumption in 1957

Animal, wood and paper and non-ferrous metal products were manufactured in Canada in greater quantities than required for home consumption, providing export balances in these groups.

On balance, Canada in the past imported large quantities of iron and steel, textiles, chemicals and non-metallic mineral products in spite of large home production. The expansion of the iron and steel, chemical and non-metallic mineral products industries will enable Canada to meet more of her requirements for home consumption and to export greater quantities in the future.

Significant changes have taken place since 1939 in the type of manufactured products made available for consumption. In that year, the iron and its products group was in leading position and contributed 19.8 per cent of the total value of manufactured products. In 1957 this group was still in first place, but the percentage went up to 29.2. The wood and paper products, non-ferrous metals, non-metallic minerals and miscellaneous industries groups also increased their share of the total, while chemicals and allied products remained unchanged. The three mineral groups, combined, increased substantially their share of the total from 35.9 in 1939 to 49.3 in 1957. This indicates a higher standard of living for the Canadian people and also reflects the great expansion and diversification in manufacturing which has taken place since 1939. The industries producing consumer goods, on the other hand, suffered a relative decline. Vegetable products dropped from 19.6 to 13.3, animal products from 11.8 to 9.1 and textiles from 13.3 to 8.1. The following table gives the relative position of the major industrial groups in 1939 and

Manufactured Products Made Available for Consumption

(Percentage of the total)

¹ For 1952 and subsequent years the figures are "selling value of factory shipments" instead of "value of products manufactured".

² Figures for the years 1928-38 are for the fiscal years ended Mar. 31 of the following years: for 1939-57 they are for the calendar year. Net imports are total imports less foreign products re-exported.

³ Consumption figures for the major groups of the Standard Industrial Classification cannot be calculated as statistics of imports and exports

**Ref still governable on the component matrixel algorithm begin. are still compiled on the component material classification basis.

SECTION 2. VALUE AND VOLUME OF MANUFACTURED PRODUCTS

Value of Manufactured Products. — In the interpretation of manufacturing values over a number of years, variations in the level of prices must be borne in mind. In recent years, due to violent changes in prices, unadjusted value series, used in isolation, have become increasingly inadequate as indicators of economic trends. Of necessity, interest has shifted to measures of volume. The range of prices since 1917, on the base period 1935-39 = 100, was as follows:

Year	General wholesale	Fully or chiefly manufactured products
1917	148.9	150.9
1920	203.2	208.2
1929	124.6	123.7
1933	87.4	9 3.3
1939	99.2	101.9
1949	198.3	199.2
1957	227.4	237.9

Volume of Manufactured Products. — Since real income is ultimately measured in goods and services, the growth of the volume of manufacturing production, as distinguished from its value, becomes a matter of great significance. The important thing to know is whether consumers are getting more goods and services, and not whether they are expending more dollars and cents. The field of industrial production, because of its dominating position in the national economy, has attracted increasing attention. This, in turn, has resulted in the need for more accurate measurements of physical output.

During the past few years, the Business Statistics Section of the Bureau's Research and Development Division has been engaged in the reconstruction of the Index of Industrial Production. The revised indexes with 1949 as the base year are given in Tables 8, 9 and 10. The project consisted mainly of establishing annual gross and net levels of production for each industry from census of industry data and of improving the reliability of the current monthly series. For a description of the methods used in constructing the indexes and a description of its scope, see D.B.S. Reference Paper No. 34 "Revised Index of Industrial Production, 1935-1951"

The construction of this index was made possible by the availability of a great deal of basic data. Annual statistics valuable for this project have been collected by the Bureau without interruption from the end of the first World War to the present, and the scope of the monthly information has been greatly expanded. Applying the methods developed through the experience of the last quarter century, it has been possible to compute an index with a fair measure of accuracy from 1935 to the present.

Prior to the end of the first World War, the movement of industrial production was regarded as following the output of a few factors such as pig iron. The introduction of the index number placed the information on a much wider base. It is safer to base one's impression of the current trend upon a comprehensive index embracing a wide range of economic factors than upon any limited group of components that necessarily fluctuate according to particular influences.

An index of this kind offers considerable advantage in analyzing social and economic problems. The greatest call for the index is for the interpretation of current economic conditions. It is particularly relevant in the study of business fluctuations. While the index is based on the sectors of the economy that are particularly sensitive to short term influences, it also reflects a large part of the variations in the total of all economic activity. The output of mines and factories plays a dominant part in economic fluctuations and is closely associated with transport and trade which are mainly concerned with the distribution of commodities. The barometric nature of the Industrial sector enhances the value of the index as an indicator of short-term movements but its usefulness in the interpretation of long-term economic developments should not be overlooked

The Canadian annual Census of Industry, from which final benchmark indexes are computed, covers practically all establishments, but excludes work in the home. In the matter of repairs, the census of manufactures generally excludes work performed in connection with a service trade such as boot and shoe and automobile repairs. However, the census covers repairs carried on essentially under industrial con-

ditions, such as ship and locomotive repairs. Consequently only industrial-type repairs are included in the index.

The framework of the revised index is based on the new Standard Classification of Industries prepared by an inter-departmental working committee. The preceding system used by the Bureau of Statistics was of a three-fold nature based on (1) chief component material; (2) purpose and (3) origin. The first principle was used most extensively, the criteria of purpose and origin having been used for the presentation of supplementary series which played a secondary role in Bureau publications.

The main innovation introduced in the Standard Classification was the compromise between the different principles. In recent years, Canada's industrial system has undergone considerable development, from a country primarily concerned with the early stages in the processing of primary materials to one that is turning out more and more goods for final consumption. Consequently, in establishing the new classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. The purpose phase was regarded as most appropriate for the wide range of consumer goods such as clothing and foods and beverages.

The industries grouped under the component material phase of the classification from 1935 to 1948 were re-arranged to conform with the standard model. As most of the industries were not greatly affected by the change in classification they were transferred intact to the proper position in the new system. The standard classification, for the most part, provided for comparability at the industry level. It was applied to establishments for the first time in the 1949 census of manufactures. In a number of industries, where the change in classification seriously disturbed the continuity, establishments were re-combined for the whole period covered by the index. The manufacture of synthetic rubber, for example, was transferred from the rubber industry to "miscellaneous chemicals". Plants engaged in the production for distribution of manufactured gas were transferred from "coke and gas" to the gas and electricity division. The salt industry was adjusted so as to comprise only processing operations for inclusion in the manufacturing division of the index. Three minor industries which were re-classified to non-industrial groups were dropped from the computation.

The appropriate series in the manufacturing division were re-classified to obtain sub-indexes of economic significance. The movement of durable goods normally varies from that of non-durables. There tends to be greater fluctuation in durables from prosperity to depression, the demand for non-durables being more constant. The manufacturing division was therefore divided, at the major group level, as between durable manufactures and non-durable manufactures. Although these groupings are rather rough and ready, they are of great use in economicanalysis. The classification into producers' and consumers' goods, attempted in some countries, involves more difficulty as many intermediate commodities have alternate uses, and was not attempted here.

Volume of Production, 1923-35. — The indexes of volume of production, 1923-1935 given in Table 7 below were constructed in the General Manufactures Section of the Industry and Merchandising Division for the years 1923 to 1946. On comparing the index for 1935 given in Table 7 which stood at 87.9 with the new index for 1935 at 86.6 on the 1935-39 base, it would appear that for the back years little significant variation existed between the two series. The indexes in Table 7 may therefore be used in evaluating the changes in the volume of manufacturing production between 1923 and 1935.

The physical volume of manufacturing production increased 50 p.c. from 1923 to 1929. When it is recalled that the population of Canada is estimated to have increased only 11 p.c. during the same period, the growth of manufacturing production is indeed remarkable. Of this advance, the part resulting from an increase in the domestic demand due to growth of population would therefore be about 11 p.c. The increase in exports was about 3.6 p.c. of the 1923 production. The remainder of the increase in production by 1929, or a margin equal to roughly 35 p.c. of the volume of manufactures of 1923, was, therefore, apparently absorbed by increases in capital equipment and by the rise in the standard of living of the population of Canada. From a high of 101.4 in 1929 the volume of production declined to 67.6 in 1932 and climbed again to 87.9 in 1935.

TABLE 7. Indexes of the Volume of Manufacturing Production, According to the Component Material Classification, 1923-35 (1935-39=100)

Year	Vegetable	Animal	Textiles	Wood and paper	Iron	Non- ferrous metal	Non- metallic mineral	Chemicals	Miscel- laneous	All industries

Volume of Production, 1935-57.— The period covered by this report was characterized by unprecedented industrial expansion. Emerging from a depression practically world-wide in scope, industrial operations in this country entered a period of rapid growth which was maintained throughout the war and post-war years without important interruption.

A problem confronting business economists is to determine how much of the post-war industrial "drive" was due to normal growth factors and how much of it was caused by the backlog of war accumulated demand. While it is true that the greatest demand accumulation took place in housing and consumer durables, non-durables such as textiles and clothing also started the post-war period with a sizeable backlog of unfilled demand. It is now becoming apparent, after the vigorous pace of business following the outbreak of hostilities in Korea, that a considerable portion of this demand has been satisfied and some industries, notably textiles, clothing, agricultural implements and some major appliances, are experiencing difficulties. However, overall prospects appear bright for the near future. The high level of capital investment during the past few years which increased productive capacity, is beginning to be reflected in current production statistics. Huge expansion and development programmes are still under way in iron ore, aluminum and other metals, oil, chemicals, electric power, and in a number of other industries. In addition, federal government expenditures for national defence should still exert some influence on the economic picture.

The volume of output of manufactures rose steeply after the outbreak of hostilities in 1939. Productive facilities responded quickly to the urgent requirements of the armed forces. In the early days of the war, production assignments allotted were comparatively simple, but as the pre-war weapons became obsolete and as Canada proved herself capable of turning out larger and more complex equipment, the assignments constantly shifted, changed and grew more difficult. The production figures merely suggest the magnitude of the achievement. They cannot describe the tremendous effort needed to convert a semi-agricultural country into a wartime arsenal nor the complications which arose because of shortages of man-power, tools and materials.

The productive peak was reached in 1944, when weapons. supplies and equipment were rolling off the assembly lines at record-breaking pace. The end of hostilities and the subsequent reconversion to peace-time production were attended with declines in output in 1945 and 1946. The upward trend was however, in 1947. The rate of advance slackened moderately in 1948 and 1949 but regained most of its 1947 impetus in 1950 when the renewal of hostilities in Korea resulted in heavy anticipatory buying on the part of consumers and in growing expenditures for national defence. A remarkable feature is that in 1953 the index of the volume of manufacturing production which stood at 126.4 had surpassed the record wartime level of 106.1 established in 1944. The following year there was a minor recession and the index dropped to 122.9. With the upturn in economic activity during 1955 and 1956 the index rose again to an all-time high of 145.1, exceeding the previous high of 1953 by 14.8 p.c. The downturn in manufacturing activity in 1957 resulted in another minor decline, with the index dropping to 142.5.

Non-durable Manufactures

The trend of output in the non-durable sector of manufacturing was visibly smoother than in the durable sector. Except for two years, 1938 and 1945, there has been no interruption in the upward movement of production during the period under review. Despite the fact that war contracts quickened the pace of output in some of the industries, production continued to expand after the war, although at a slower rate. Unlike durable goods, non-durable commodities are mostly consumers' goods and are less influenced by sudden changes in the international

situation or the capital investment programmes of producers and governments. By 1957 the non-durables index of output had reached 139.3, the highest on record.

The production of Processed Foods and Beverages rose practically without pause throughout the period. A characteristic of most industries processing foods is the high ratio of the value of materials consumed to the value of products, indicating a relatively low degree of fabrication per unit of output. The volume of processed foods manufactured increased by a third since 1949 as compared with an increase of 23 p.c. in

population. The per capita increase in the use of processed foods is due mainly to the high level of economic activity with the resultant increase in personal income during the period. All industries in the food group, with the exception of flour mills, reported increased volume since 1949, ranging from a high of 67.7 p.c. for fruit and vegetable preparations to a low of 9.9 p.c. for confectionery. The decline of 11 p.c. in the output of the flour milling industry is due to a decline in export shipments and not to a drop in domestic consumption. In all probability the consumption domestically of flour and other products of the industry increased as well.

The advance in the production of Beverages was also practically uninterrupted from 1949 to the present. The increase in the volume was 43.2 p.c. which was 10 p.c. higher than the increase in the volume of processed foods. The greatest increase in the beverage group was reported by distilleries with a 70 p.c. increase in volume. This does not represent the increase in the domestic consumption of alcoholic beverages since this industry, too, exports a substantial part of its production, exports of whisky rising from 4,149,473 proof gallons in 1949 to 7,642,050 proof gallons in 1957. The brewing and carbonated beverages industries also reported substantial increases in volume since 1949, the increase being 39.5 and 29.7 p.c. respectively. In the case of these products the increases represent increased consumption in Canada, as the export trade is insignificant. Wine production, after reaching a peak in 1950, dropped about 14 p.c. in the following three years. There was a recovery in 1954 which continued until 1957, with the result that the volume of the industry advanced about 16 p.c. between 1949 and 1957.

The great demand for cigarettes for members of the armed forces during the war contributed largely to the considerable increase in the **Tobacco Products** index which reached the record level of 103.2 in 1945. The index dropped to 90.6 the following year, but rose gradually thereafter to 103.4 in 1950. Weakening demand led to a decline of 8 per cent in 1951. Rapid recovery was made during the next six years with the index rising to 161.0 in 1957, highest on record.

The contribution of the Rubber Products industry to the war effort was mainly in the form of tires and tubes for military vehicles and aircraft. Production of passenger car tires and tubes was sharply curtailed as was the output of rubber footwear. After a marked increase in 1941, the index remained more or less stationary at around 85 until 1945 when civilian production was resumed and the index jumped to 102.1. The industry-wide strike in 1946 contributed to a decline in that year, but record-breaking demand for the industry's output led to sharp advances in the following years, and in 1951 the index had reached the maximum level of 124.9. During the next few years the index fluctuated moderately and in 1957 climbed to 147.8.

Output of Leather Products rose steadily until 1946 when the index reached a high point of 124.0. The subsequent easing of foreign demand for the industry's products contributed to the gradual decline of production in the post-war period with the result that this group has shown the second smallest growth of any in the manufacturing sector. In 1957, volume of output was only 15.6 per cent greater than in the base period. Production of leather tanneries in 1954 was actually 6.0 p.c. lower than in 1949, while the output of boots and shoes was only 4 per cent higher. Some recovery was made between 1955 and 1957, the output of tanneries increasing 10 p.c. and footwear 21 p.c. over the base period. Since 1946 the overall index of this group dropped 7 p.c.

The Textile industries reached their maximum wartime level of output in 1942 when the index stood at 102.0. Production then fell off gradually until 1946 but recovered sharply in the post-war period to an index level of 113.1 in 1951. A slackening of demand for textiles during the next few years saw the index drop to 102.9 in 1952 with another sharp drop to 94.3 in 1954. Of all the industries of the non-durable goods sector, textiles were the hardest hit by the downturn in manufacturing activity in 1954. There was substantial recovery between 1955 and 1957, with the index rising to an all-time high of 117.6. The movement of individual industries within the group varied over the period under review. The greatest advance in volume of production since 1949 was achieved by

the synthetic textiles and silk industry, the index in 1957 standing at 156.6. Miscellaneous textiles which includes cordage, rope and twine as well as carpets, mats and rugs recorded the second highest increase, viz. 21.2 p.c., while cotton goods, after experiencing varied fluctuations in production, ended 1957 with no change in volume, the index being 100, the same as in 1949. Output of woollen goods on the other hand declined by 13.1 p.c., the index in 1957 standing at 86.9.

The trend of production since 1935 was similar for both the cotton and woollen goods industries. Before the war both groups expanded moderately and in both cases a major recession occurred in 1938. With the outbreak of war in 1939 there was a marked increase in production, with record highs being reached in 1942 when the respective indexes were 128.2 and 111.3. There was thus an increase of 63 p.c. in the output of cotton goods and 71 p.c. in woollen goods between 1939 and 1942. With the end of the war the production of both cotton and woollen goods declined sharply to a post-war low in 1954 when the index for cotton goods dropped to 86.7 and for woollen goods to 72.0. Some recovery took place during 1955, 1956 and 1957, the index rising to 100 in the case of cotton goods and 86.9 for woollen goods.

Since 1938 the production index for Synthetic Textiles showed an unbroken record of increases and in 1951 stood at 134.0. The adverse conditions prevailing in the textile industry generally during the following few years also affected the output of synthetic textiles so that by 1954 the index stood at 108.7. There was a marked recovery the following year which continued throughout 1956 and 1957. By the end of 1957 the index which reached 156.6 was the highest on record. Much of the credit for increasing consumer acceptance of synthetics belongs to the achievements of research in improving manufacturing and dyeing techniques and in the development of new combinations of various fibres with a new range of qualities and practical applications.

Synthetic fibres are now being used in the fabrication of a host of commodities such as suitings, overcoatings, blankets, carpets, draperies, upholstery products, thre fabrics, etc., in addition to hosiery, dress fabrics and other women's wear. Moreover, Canadian producers are now supplying the bulk of domestic synthetic raw material requirements which were formerly imported from the United States. As a result, new investment outlays by the industry have increased considerably in the post-war period.

The trend in the physical output of clothing was similar to that of other textiles, the production index reaching a peak of 100.9 in 1942, then declining gradually until 1945. Since then output fluctuated within narrow limits. For the clothing group as a whole there was an increase of 15.3 p.c. in volume of production since 1949. This is the smallest increase reported by any group in both the durable and non-durable classifications. The leather and textile groups, as mentioned previously, were the only other groups to report such moderate increases in volume. For leather the increase was 15.6 p.c. and for textiles 17.6 p.c. The trend of production varied from industry to industry in the clothing group. The output of knitted goods since 1949 was 26.6 p.c. higher. Men's, women's and children's clothing gained 12.6 p.c. while miscellaneous clothing which includes corsets, fur goods, hats and caps, etc. advanced 10.4 p.c. These increases are significant when compared with the 23 p.c. increase in population during the same period. The industry is now facing keen competition and a more selective retail demand. By improving manufacturing methods and styling, the industry hopes to make available more desirable merchandise at lower prices. Weak demand contributed to a marked decline in the level of new investment in durable physical assets. Funds expended for new plant, machinery and equipment dropped from \$15.7 million in 1949 to an average of \$13.0 million during the next four years. From 1954 to 1957 investment dropped to \$9.9 million per annum.

Production by the industries of the **Paper Products** group expanded almost uninterruptedly during the period under review. The post-war period saw a sharp advance in output, the index rising to 81.0 in 1946 from an annual average of about 55 during the previous decade. From then on there was, with but two exceptions, a continuous expansion to 135.5 in 1957. Activity in this sector of manufacturing is influenced mainly by the

"Pulp and Paper" industry, which, in terms of value added, is the most important single manufacturing industry. In the last few years, the net value contributed by pulp and paper mills was almost twice that of any other industry. The growth of this industry during the period under review was characterized by two distinct phases. From 1935 to the end of the war, new investment by the industry was designed mainly to replace worn-out machinery and equipment and increases in output were principally the result of utilizing idle capacity after the depression of the thirties. Since 1945, however, with strong world demand for wood pulp and newsprint, together with the availability of necessary materials for expansion, the construction of new plant and the installation of new machinery and equipment reached record proportions. Investment in new plant and equipment, which averaged \$105 million during the previous three years dropped to \$69 million in 1954, a decrease of \$36 million from the record high reported in 1952. Capital investment reached the unprecedented total of \$240 million in 1956 and \$234 million in 1957.

Newsprint, pulp and paper board are the leading products of the pulp and paper industry. Production of newsprint in 1957 totalled 6,361,651 tons of which 5,900,625 tons were exported. Canada is thus the leading exporter of newsprint in the world. World exports of newsprint in 1954 are estimated at 6,788,000 tons, with Canada accounting for 81.3 p.c. of the total. Finland, Sweden and Norway, in the order named, are other substantial exporters of newsprint and between them have accounted for 10.5 p.c. of the total. Newsprint is also Canada's leading export and 1957 was valued at \$715,489,761.

The **Printing and Publishing** industries expanded very little during the war years. Production grew rapidly after the end of hostilities and in 1957, volume of output was 15.8 p.c. greater than in the five pre-war years, although this represents a substantially smaller advance than total manufacturing. The post-war increase coincided with the gain in the value of new investment which was mainly in the form of machinery and equipment to make up for deficiencies dating back to the depressed thirties and the war years. Investment in fixed assets totalled \$16 million in 1953 and \$30 million per annum in 1954 to 1957 as compared with only about \$2 million in 1944.

With few interruptions, output of Petroleum and Coal products rose steadily over the period under review to an index of 223.5 in 1957. Although the production of coke products in 1957 exceeded its record wartime volume by 15.6 p.c., petroleum refining, as the result of record-breaking post-war demand for gasoline and fuel oils, showed a marked expansion. In 1957

the production index stood at 236.8 compared with a wartime high of 69.0 in 1944. In recent years the industry has added substantially to its refining capacity. From 1947 to 1951 expenditures for new plant, machinery and equipment which averaged more than \$37 million per annum rose to \$84 million during 1952, 1953 and 1954 and to \$111 million in 1955, 1956 and 1957. Some of this rapid growth is associated with the remarkable progress made in the exploitation of western crude oil reserves. In 1957 oil from domestic wells represented 54 per cent of the total consumed by Canadian refineries. This compares with a contribution of 22 per cent in 1949.

Output of Chemical Products which include ammunition and explosives reached a record-high level in 1944 when the index stood at 143. Production in the post-war period has been at a considerably lower level, but increased significantly since 1950, with the advent of the defence programme. The index in 1957 stood at 182. The expansion of the industry during the war made possible the manufacture of many products which were formerly imported. In addition, several entirely new products, such as synthetic rubber, were introduced. Demand for these commodities continued in the post-war period and the development of new sources of basic materials, together with the progress of research into additional commercial uses for these new compounds resulted in further expansion of production for civilian use.

The rapid wartime advance was mainly the result of the enlargement of the munition programme with the government and private industry combining forces in the construction of a huge explosives and ammunition-filling industry. At its peak in 1943, the production index for Explosives and Ammunition was 20 times higher than in the five year period preceding the war. With the end of the war output dropped very rapidly, the products made being mainly for peace-time use, such as explosives for the mining and construction industries.

Since the Government-owned Polymer Corporation began producing Synthetic Rubber in 1943, output of this important commodity has expanded considerably, to a total of 145,200 tons in 1957. Production declined somewhat in 1947 and 1948 when imports of natural rubber were resumed, but recovered strongly to record levels since 1950, as the defence programme gathered momentum and as the rubber requirements of the motor vehicles industry rose to a new maximum. During 1957, synthetic rubber accounted for 45 per cent of total new rubber consumed in Canada. This commodity is classified to the Miscellaneous Chemicals industry.

Durable Manufactures

The tremendous increase in physical output during the war years was mostly concentrated in the durable goods sector. When war was declared in September, 1939, there were virtually no armament works, no production of large ships and large planes, no guns, no tanks. Within a few years Canadian plants were turning out naval and merchant ships, warplanes ranging up to the 15-ton Lancaster bomber, military vehicles, millions of rounds of ammunition and hundreds of other war items. By 1944 the volume index of durable manufactures reached a peak of 128.3. During the following two years it declined sharply and stood at 79.9 in 1946. Since then it has regained the lost ground, reaching an all-time high of 153.3 in 1956, 19.5 p.c. above the war-time peak of 128.3. In 1957 there was another minor decline, with the index dropping to 146.2.

The largest gain during the war years occurred in the output of Transportation Equipment. Due principally to the tremendous increases in production of ships and aircraft, the index for this group of industries rose to the record level of 236 in 1944, the year of maximum war production. After reaching a post-war low of 81 in 1946, the index rose moderately during the next three years, but, spurred by the great demand for passenger cars and by the renewal of defence production, marked gains were made since 1950, with the index climbing to 165 in 1953. The minor recession in industrial production in 1954 affected this group more than any other. The index dropped to 137, a decline of 16.9 p.c. as compared with the previous year. The recovery in production during the next two years brought the index up to 157.9 in 1956. The minor recession which commenced in the latter part of the year lowered the index to 150.7 in 1957.

The Iron and Steel group of industries was also considerably affected by war requirements. As most of the industries in this sector were more firmly established in the pre-war period, they did not expand relatively to the same extent as shipbuilding and aircraft. Production for the group as a whole reached a maximum of 132 in 1943 and with the end of the war dropped to an average of 88. Recovery which commenced in 1947 continued with but few interruptions to an all-time high of 145 in 1956. In 1957 the index slipped to 140. When European supplies were cut off early in the war, the Canadian basic steel industry had to rely on the United States for a greater supply and had to increase its own steel-making capacity to meet abnormal wartime requirements. However, development of the industry did not halt with end of hostilities. Canada's industrialization programme, together with strong post-war demand for consumers' durable goods, led to steady expansion of the industry so that by 1951, the index for the primary iron and steel industry stood at 129. Compared with pre-war, pig iron output had more than tripled, and steel ingot and casting production had risen by 170 and 74 per cent respectively. Due to the contraction in the demand for durable goods in 1954 the index for the group dropped to 95, down to about the 1947 level. Pig iron at 2,211,000 tons was down 27 p.c. and steel ingots at 3,195,000 were 22 p.c. lower. However, rapid recovery was made in 1955 and 1956 when the index rose to 158, thirty per cent above the record war-time high of 122 attained in 1943. Production of pig iron in 1957 totalled 3.718.350 tons and steel ingots and castings 5,068,149 tons. The additional capacity constructed during the past few years should reduce still further the country's dependence on United States imports of finished and semi-finished iron and steel shapes. Indicative of the rapid growth of the industry in recent years is the amount of funds expended for new plant, machinery and equipment, From an average annual expenditure of \$62 million during the previous five years new investment jumped to \$136 million in 1952 and \$114 million in 1953. New investment in 1954 and 1955 averaged \$92 million and in 1956 and 1957 reached the record average of \$171 million per annum.

To meet the need for electrical and radar equipment and signalling devices, the Electrical Apparatus and Supplies industry manufactured articles during the war which were previously not made in Canada. Output of civilian radio

receiving sets and appliances was severely curtailed as the industry converted the major part of its productive capacity to the manufacture of war instruments. The production index reached a wartime peak of 86 in 1944 and declined during the next two years. The industry recovered rapidly, however, as a result of accumulated demand for radios, consumers' appliances and heavy electrical equipment, and by 1952 the index had jumped 84 per cent from its 1946 post-war low, to a level of 125. Due mainly to the heavy demand for television sets, the index in 1953 advanced sharply to 151, an increase of 21 per cent over the previous year. The advance continued throughout the next three years and the index rose to an all-time high of 191 in 1956. Following the general trend of moderate declines in the output of durable goods, the index slipped to 181.5 in 1957.

Production in the Non-ferrous Metals group of industries reached a wartime maximum in 1943 when the net index stood at 146. During the next three years, output dropped 44 per cent, but recovered steadily thereafter, backed by sustained demand for base metals. In 1957 the index stood at 129, a decrease of 11.7 p.c. from the war-time high of 146. Aluminum which is an important component of the group is being fabricated into an ever-increasing variety of commodities, and production of aluminum bars and rods, sheets, shapes, etc., reached record proportions in the post-war period. During the war years, aluminum sheet production was of a strong alloy type used principally in aircraft construction and required more fabrication than the regular type of sheet used in the production of cooking utensils and other civilian items.

Military requirements did not affect the nature of output in the Non-metallic Mineral products group of industries. In war or peace, the bulk of production consists of construction materials such as cement, cement products, building brick, lime and gypsum products, glass, stone products, etc. During the war, under government control, a major proportion of these industries' products were channelled into construction of new war production plants, extensions to pre-war plants, housing for war workers and the building of training and operation facilities for the armed services. No serious reconversion problems were encountered by the non-metal industries immediately following the war. After a slight pause, following the peak of wartime output, plants turned their productive capacity towards meeting the unprecedented demands of the post-war construction boom. From a wartime maximum of 69 in 1943, the volume index dropped moderately in 1944 and 1945, but rose steeply in succeeding years to reach the record level of 193 in 1957.

In the durables sector, the Wood-using industries were the least affected by the war. The volume of output of wood products expanded steadily without serious interruption throughout the war and post-war years. In 1953 the index stood at 125, the highest on record. In 1954 the index declined fractionally to 124, but advanced sharply the following two years to an all-time high of 138 in 1956. In 1957, due to the continued decline in exports, the index dropped to 125, the 1953 level. The two most important industries are "sawmills" and "furniture". The index representing the former, after reaching a war-time maximum of 90 in 1942, declined considerably in 1943, and hovered around 79 during the next two years. Beginning in 1946 output rose sharply, spurred by strong foreign demand for sawn lumber, and by 1955 the index had advanced to 134, the all-time high. Exports of planks and boards, shingles, veneer and plywood were considerably lower in 1956 and 1957. This is reflected in the moderate decline of the index to 131 in 1956 and a sharper decline to 115 in 1957. Production in the furniture industry expanded throughout the period under review. The great increase in residential construction in the post-war period, together with the marked gain in new family formations created a boom for producers of house furnishings. Output of furniture jumped sharply in the three years immediately following the end of the war and rose more gradually during the subsequent years. After reaching an all-time high of 141 in 1956, the index declined to 134 in 1957.

SECTION 3. PRODUCTION BY INDUSTRIAL GROUPS AND INDIVIDUAL INDUSTRIES

Subsection 1. Manufactures Grouped on the Standard Classification Basis

In interpreting the statistics of individual industries, it should be remembered that the figures on employment, production, etc., do not refer to individual products but to all the products made in an industry. For example, the value of production of the confectionery industry, amounting to \$104,853,748 in 1950, does not imply that this was the value of confectionery produced. What it means is that the firms whose principal product is confectionery had a value of production of \$104,853,748. This figure, in addition to confectionery, includes all the subsidiary products made by these firms such as ice cream which was valued at \$2,214,689 and bread and other bakery products valued at \$2,214,689 and

tionery is also produced as a subsidiary product by firms credited to other industrial classifications. For total production figures of individual products, reference should be made to "The Alphabetical List of Products" published annually as Appendix II to this report.

Table 11 presents for the year 1957 detailed statistics regarding the individual industries under which all industrial plants in Canada are classified. The industries are further assembled under seventeen main groups according to the Standard Industrial Classification.

² This industry still reports "Value of production at the factory" and not "Selling value of factory shipments".

Table 12 gives the amount and value of each of the principal commodities produced or shipped by the manufacturing industries of Canada, Commodities produced in small quantities

are not included but the list covers approximately 75 p.c. of total production. For a complete list of products, see Appendix II of this report.

TABLE 12. Quantities and Values of the Principal Commodities Produced or Shipped by the Manufacturing Industries of Canada, 1957

Note: Since 1952 the basis of collection is "Value of factory shipments" instead of "Gross value of products". However, the commodities marked* are still on a production basis.

marked* are still on a production basis.			
	Unit of measure	Quantity	Value
			\$
Food: Biscuits, all kinds Bread Bread Butter, factory made Cheese, factory made Coffee, instant Coffee and tea, blended, roasted and packed Confectionery, all kinds Crean, sold by dairy factories	lb. ton lb.	242, 635, 871 826, 588 301, 228, 146 176, 527, 261 6, 182, 099 119, 176, 679	72,510,280 198,515,372 180,443,025 62,499,685 21,495,741 115,128,181

Subsection 2. Manufactures Classified on the Chief Component Material Classification Basis

For the most purposes a classification of manufacturing industries based upon "chief component materials" has, in the past, proved most useful in Canadian industrial classification. For this reason the Bureau's classification based upon this concept has been the one most widely used for general purposes such as the Decennial Census, Vital Statistics, foreign Trade, etc. Even for these purposes some modification has been deemed expedient, such as the inclusion of a group "Textile Products", composed partly of animal and partly of vexetable products.

When the industry of a country is primarily concerned with the early stages in the processing of primary materials, i.e., when its final products are chiefly such items as pig fron, lumber and processed fish, a classification based upon chief component material is wholly applicable. As manufacturing industry develops, however, turning out more and more goods for final consumption, the combination of ingredients in such output becomes more and more complex. The modern automotive, aircraft, shipbuilding, and electrical apparatus industries are examples in which a wide variety of materials must be assembled for the completion of the final product.

In recent years Canada's industrial system has undergone considerable development. Consequently in establishing the Standard Industrial Classification, the concept of "purpose" has been combined with that of "chief component material" in the framework of the classification of manufacturing industries. For the classification of consumers' goods industries the concept of "purpose" seems most applicable both in terms of common usage in referring to industries and in providing the type of data most often required. Hence, such major groups as Foods and Beverages, Clothing, Transportation Equipment, Electrical Apparatus and Supplies, have been established.

¹ In 1952 the basis of collection was changed from "Value of products made" to "Value of factory shipments".

Subsection 3. Manufactures Classified by Origin of Materials

The distinction made between farm materials of Canadian and foreign origin is based on whether the materials are indigenous to Canada rather than on their actual source. Thus, the industries included in the foreign origin classes are those depending upon materials that cannot be grown in Canada, such as tea, coffee, spices, cane sugar, rice, rubber, cotton, etc. Industries included in the Canadian origin classes may, however, be using large quantities of imported materials.

The mineral origin group includes, in addition to nonferrous metals so largely produced in Canada, the manufactures of iron and steel, or petroleum, and of other mineral substances, the raw materials for which are very largely imported. Products of mineral origin, with the exception of fuels, are nearly all durable goods. A high standard of living and advanced industrial organization is usually indicated by relatively large production and consumption of mineral products. During periods of depression when the production of capital goods is curtailed, employment in the industries of the farm group, which produce mainly consumer goods, exceeds that of the mineral group. The industries of the mineral group in 1943, at the maximum of the war effort, had by far the greatest capital investment, employed the largest number of persons, and paid out the highest amount in salaries and wages. In 1943 the average capital per employee amounted to \$5.441 for the mineral group as compared with \$4,417 for the farm origin group. The mineral group and wage was \$4,083 for the mineral group and \$2,987 for the farm origin group.

¹ For the year 1924 the figures for "Cost of materials" and "Gross value of products" include the value placed on intermediate products used in further processes in the chemical group of industries. For this reason these figures differ slightly from those contained in the other tables of this report.

² In 1952 the basis of collection was changed from "Value of products made" to "Selling value of factory shipments".

Subsection 4. Manufactures Classified by Type of Ownership

This section deals with the type of ownership under which Canadian manufacturers operate. The first survey in 1946 did not include the fish-curing and packing industry, information for which was not available at that time. For this reason the figures for 1946 are not strictly comparable with those for succeeding years, although the inclusion of that industry has not materially altered the percentage distribution of individual ownership, incorporated companies, etc.

Of the 37,875 establishments operating in 1957, 1,623 establishments in the periodical publishing industry were unclassifiable, leaving 36,252 establishments in the four

categories of ownership. Individual ownership numbered 14,721 establishments, partnerships, 4,352, incorporated companies 16,260 and co-operatives 919. The percentage distribution of the four categories of ownership are given below for the years 1946 to 1957. It is interesting to note that incorporated companies are becoming increasingly important, the percentage of the total number of establishments having risen from 33.4 in 1946 to 44.9 in 1957 while the other three categories declined in importance. This trend to incorporation is no doubt accentuated by the favourable income tax rate allowed companies on the first \$25,000 of income.

Year	Individual ownership	Partnerships	Incorporated companies	Co-operatives
1946 (estimated)	47. 3 46. 4 46. 2 46. 0 45. 6 44. 6 44. 9 44. 4 43. 6 42. 7 41. 4 40. 6	16. 0 16. 1 16. 4 15. 8 15. 0 15. 5 14. 8 14. 3 13. 6 12. 7	33. 4 34. 3 35. 3 36. 3 36. 9 38. 2 39. 5 41. 1 43. 4	3. 3 3. 2 3. 0 2. 9 3. 1 3. 0 2. 8 2. 6 2. 6 2. 6 2. 5

As is to be expected, the smaller establishments, regardless of the type of products manufactured, are carried on mainly under individual ownership or partnerships. Industries conducted on a small scale usually contain a large number of establishments in this category, the percentage decreasing as the scale of operation increases. As the above table shows, establishments under individual ownership comprised 40.6 p.c. of the total number engaged in manufacturing in 1957. Partnerships accounted for 12.0 p.c., incorporated companies 44.9 p.c. and co-operatives 2.5 p.c.

Of the 12,520 establishments with shipments of under \$25,000, 73.8 p.c. were individual ownership, 15.5 p.c. partnerships, 10.1 p.c. incorporated companies and .6 p.c. co-operatives. With the increase in the size of the establishment the importance of individual ownership as well as that of partnerships declines. In the case of incorporated companies, however, the opposite is true. As the size increases their numerical importance increases as the following table shows.

TABLE 15. Percentage Distribution of the Manufacturing Industries of Canada, by Type of Ownership and Size of Establishment, 1957

	Under \$25,000	\$25,000 to \$99,999	\$100,000 to \$499,999	\$500,000 and over
Establishments: Individual ownership Partnerships Incorporated companies	73. 8 15. 5 10. 1	44. 7 16. 9 35. 5	12. 2 8. 1 74. 4	0. 7 1. 0 96. 4
Co-operatives	0. 6	2. 9	5. 3	1. 9

Employees: Individual ownership Partnerships Incorporated companies Co-operatives Total	66. 8 19. 1 13. 5 0. 6 100. 0	38. 3 17. 2 42. 9 1. 6 100. 0	7. 7 6. 7 83. 7 1. 9	0. 2 0. 3 98. 9 0. 6
Factory shipments: Individual ownership Partnerships Incorporated companies Co-operatives Total	69. 7 16. 1 13. 3 0. 9 100. 0	40. 5 16. 5 39. 5 3. 5 100. 0	9. 0 6. 9 79. 3 4. 8 100. 0	0. 2 0. 2 98. 7 0. 9 100. 0

The establishments operating under individual ownership are not as important, from the point of view of employment provided, as their large numbers would indicate. According to Tables 16 and 17, these establishments which comprise 41 p.c. of the total have only 5 p.c. of the total employees. Partnerships accounted 12 p.c. of the number of establishments and 2 p.c. of the total employees. Incorporated companies with 45 p.c. of the number of establishments had 92 p.c. of the employees. Co-operatives with 2 p.c. of the establishments had 1 p.c. of the employees.

On the basis of employment provided, incorporated companies are, by a wide margin, the most important factor in the

employment field. In the petroleum and coal products group practically 100 p.c. of the employees were reported by such companies, while the rubber, electrical apparatus and supplies, paper products, transportation equipment and tobacco products had 99 p.c. Companies in the chemicals and non-ferrous metal products had 98 p.c., fron and steel products 97 p.c., textile mills 96 p.c., knitting mills and non-metallic mineral products 94 p.c., leather products 93 p.c., miscellaneous industries 90 p.c., printing, publishing and allied industries 88 p.c., clothing 85 p.c. and foods and beverages 83 p.c. Companies in the wood products group with 78 reported the lowest percentage of the total employment.

Subsection 5. Leading Manufacturing Industries

In the following statement, the rank of the ten leading industries in 1957, from the standpoint of gross value of

production or value of shipments is compared with their respective ranks in significant years since 1922.

Industry	Rank in									
ALCOUST,	1957	1949	1944	1939	1933	1929	1922			
Pulp and paper	1	1	5	2	1	1	2			
Petroleum products	2	5	14	6	6	10	9			
Non-ferrous metals smelting and refining	3	3	2	1	2	9	1			
Motor vehicles	4	4	7	5	11	4	6			
Slaughtering and meat packing	5	2	1	3	3	2	3			
Primary iron and steel	6	8	13	11	31	16	20			
Sawmills	7	6	11	8	14	5	4			
Butter and cheese	8	7	10	4	5	6	5			
Aircraft and parts	9	1	4	1	1	1	1			
Railway rolling stock	10	9	16	16	23	7	24			

¹ Did not rank among the forty leading industries that year.

A prominent feature of Canadian Manufacturing development during the past twenty-five years has been the rapid growth of non-ferrous metal smelting. This industry, based upon the rich base-metal resources of the country, has taken its place among the leading manufactures, along with the industries based upon forest, agricultural and live-stock resources. Another feature of this development in manufacturing production is the rise of the petroleum products industry from fourteenth place in 1944 to second place since 1957. This is the direct result of the recent discoveries and development of the large oil resources of the Prairie Provinces and the rapid industrialization of Canada during the past decade.

The incidence of the depression resulted in a re-arrangement of the ranking of many industries which in some cases has proved to be temporary. During the war, the industries engaged in producing the equipment needed by the armed forces, such as shipbuilding, aircraft, automobiles, miscellaneous chemical products, and primary iron and steel, advanced to higher positions. When the war ended, the industries engaged in the production of consumer goods, by reason of the expanded demand for their products, bettered their position. Pulp and paper, after a lapse of a number of years, resumed its premier position.

The impetus given to Canadian manufacturing production by the Korean war is reflected in the advance of the aircraft industry to ninth position. This industry which did not rank among the forty leading industries before World War II was in fourth place in 1944 and sixteenth place in 1952. The ship-building industry also bettered its position as a result of the defence program occasioned by the Korean war. This industry which did not rank among the forty leading industries in 1949 advanced to thirty-fourth place in 1952 and 1954. With the slackening in defence spending, operations declined with the result that since 1955 this industry, again, does not rank among the forty leading industries.

The recovery from the minor recession experienced in 1954 resulted in some major changes in the ranking of the leading industries. Volume of output of the durable goods industries between 1954 and 1957 advanced by 17.1 p.c. as compared with 14.9 p.c. for non-durable goods. A number of the industries producing durable goods accordingly bettered their position since 1954. Motor vehicles advanced from fifth to fourth place, primary iron and steel from eighth to sixth place, railway rolling stock from eleventh to tenth place. Petroleum products which is a non-durable goods industry also advanced from third to second place. A number of the industries producing non-durable goods declined in relative importance. In this category were: slaughtering and meat packing which declined from fourth to fifth place, sawmills from sixth to seventh place, and butter and cheese from seventh to eighth place. Non-ferrous metal smelting and refining which is credited to the durable goods sector also declined during the period, dropping from second to third place. Pulp and paper and aircraft and parts retained the same position in both years, viz. first and ninth place respectively.

TABLE 21. Principal Statistics of the Forty Leading Industries of Canada, Ranked According to Selling Value of Factory Shipments, 1957

SECTION 4. PRINCIPAL FACTORS IN MANUFACTURING PRODUCTION

The subjects treated under this Section include capital, inventories, employment, salaries and wages, size of establishments and power and fuel used in manufacturing.

Subsection 1. Capital and Repair Expenditures

Prior to 1944 the following information on capital investment was collected: Fixed Capital—Land, buildings, fixtures, machinery, tools and other equipment. Working Capital—(1) Inventory value of raw materials, stocks in process, fuel and miscellaneous supplies on hand; (2) Inventory value of finished products; (3) Cash, bills and accounts receivable, prepaid expenses, etc. This was replaced by the collection of statistics on the expenditure on fixed capital and repairs.

The remarkable increase in capital employed in Canadian manufactures from the beginning of the twentieth century has, of course, run parallel with the rapid growth in industrial operations. From 1900 to 1905 the capital increased from \$446,900,000 to \$833,900,000 and advanced to \$1,958,700,000 in 1915. During this period returns were received from establishments with 5 hands or over, and, while the rise in wholesale prices did not exceed 37 p.c., the capital employed in manufactures increased nearly 340 p.c.

Capital expenditures by manufacturers in 1957 totalled \$519,900,000 for construction and \$959,000,000 for machinery and equipment, while \$613,900,000 went for repairs. Of the total

capital expenditures amounting to \$1,478,900,000 in 1957, 18.0 p.c. was reported by paper products, 12.1 p.c. by iron and steel products, 10.1 p.c. by chemicals and allied products, 9.8 p.c. by non-ferrous metal products, 8.8 p.c. by products of petroleum and coal, 7.9 p.c. by foods and beverages, 5.3 p.c. by nonmetallic mineral products, 4.2 p.c. by transportation equipment, etc.

Of the groups reporting capital expenditures of \$50,000,000 or more in 1957 seven reported increases and only one, viz. non-metallic mineral products a decrease of \$41,400,000. In 1956 wood products also reported capital expenditures of over \$50,000,000 which declined to \$39,000,000 in 1957. Of the groups reporting increases, products of petroleum and coal with \$37,000,000 led the list, followed by non-ferrous metal products with \$27,000,000, iron and steel products \$17,100,000, paper products \$8,900,000, foods and beverages \$8,000,000, chemicals and allied products \$4,800,000 and transportation equipment \$2,100,000. Besides the wood products group which reported a decline of \$11,800,000 in 1957, the leather products group was the only other group to report a decline which amounted to \$700,000.

Variation in Capital Expenditure 1957 Compared with 1956

Group	1957	1956	Variation
		\$'000,000	
Paper products	266. 3	257. 4	+ 8.9
Iron and steel products	179. 6	162. 5	+17. 1
Chemicals and allied products	149. 7	144. 9	+ 4.8
Non-ferrous metal products	144. 4	117. 4	+27. 0
Products of petroleum and coal	130. 0	93. 0	+37. 0
Foods and beverages	117. 1	109. 1	+ 8.0
Non-metallic mineral products	78. 6	120. 0	-41. 4
Transportation equipment	62. 4	60. 3	+ 2.1
All groups	1, 478. 9	1, 393. 8	+85. 1

Capital expenditures in 1957 increased by \$85,100,000 as compared with an increase of \$447,500,000 in 1956 which had the highest annual increase on record. Since 1950 there were five years with increased capital expenditures. These were—1951, 1952, 1955, 1956 and 1957. Two years, viz. 1953 and 1954 reported declines. The greatest decline amounting to \$146,900,000 occurred in 1954 and reflects the recession of that year.

Expenditures on capital assets which averaged \$1,054,000,000 during the past seven years reflect the expansion and modernization which the manufacturing industries of Canada have experienced. Although the expansion was at a rapid rate, not all provinces, however, shared in this expansion at an equal rate. Newfoundland had relatively the highest capital expenditures of any province, the percentage of capital expenditures to the value of factory shipments during the period 1950-54 being 11.0 more than

double the Canada average. Alberta with 10.7 was in second place and British Columbia with 7.3 was in third place. Ontario and Saskatchewan equalled the Canada average of 4.9, while Prince Edward Island, Nova Scotia, New Brunswick, Quebec and Manitoba were below this figure.

Some changes in the pattern of capital expenditures was evident during the period 1955 to 1957. All provinces, with the exception of Newfoundland and Prince Edward Island, reported higher expenditures in dollar values. British Columbia with 11.6 p.c. displaced Newfoundland from the premier position as regards capital expenditures as a percentage of value of shipments. With the exception of Newfoundland, Prince Edward Island and Saskatchewan, all provinces reported increases in the percentage of capital expenditures in relation to shipments. For Canada as a whole the percentage rose from 4.9 in the 1950-54 period to 6.0 in the 1955-57 period.

Comparison of Capital Expenditures with Value of Factory Shipments, 1950-1957

	Annu	al average, 1950) - 54	Annual average, 1955 - 57

Figures not compiled separately; they are, however, included in the total. See Table 22.
 Includes "Knitting mills".
 Includes allowance for capital items charged to operating expense.

Subsection 2. Value of Manufacturing Inventory

As explained in the section on Capital Employed, the collection of statistics on capital investment by manufacturers was discontinued in 1944. This was replaced by the collection annually of expenditure statistics on fixed capital, repairs and maintenance from all large manufacturers, with estimates being made for the smaller establishments. As a result of this change no information was available on investment in inventory. Before long, however, the need for this information became apparent. Consequently, beginning with 1949, calendar year-end inventory values were collected separately from all manufacturing plants with an annual gross value of production of \$50,000 or over.

These values are inflated to a total by estimating for small firms in each industry on the basis of the gross value-inventory ratio of reporting firms.

Commencing with 1954 questions on inventory were put back on the forms used in the annual survey of manufactures. As a result, all establishments with shipments of \$50,000 or more were required to give this information. As in the case of the calendar year-end series, estimates for establishments with shipments of under \$50,000 were made on the same basis. By comparing the two series for 1954 it was found that they

differed slightly. This is mainly due to the difference in time of reporting this information. In the first series the figures refer to the end of December while in the second they refer to the company year which in a number of cases might be anywhere from the end of January to the end of June. The figures in the first series are accordingly higher by 3.6 p.c. This is due to the desire of most companies to have as low an inventory as possible at the end of their financial year. When the financial year is other than the calendar year they could and usually do report a higher figure for December than they do for the end of their financial year which is reported in the second series.

It should be noted that the calendar year-end values as shown in the table below are not strictly comparable with those published in previous general reviews on manufacturing, since the series previously published has been reduced by the entire value of inventories held but not owned, i.e. held under progress payments arrangements. The deduction was made from the goods in process component. In previous reviews an item of

total inventory holdings was shown separately, but no attempt was made to assign it to any specific component. While the assumption that all such inventory is part of goods in process is not strictly true, it is nevertheless a fairly good working approximation.

Company year-end inventory in 1957 totalled \$3,973,000,000 of which amount \$1,890,900,000 was reported as raw materials and supplies, \$844,900,000 goods in process and \$1,155,100,000 as finished goods, while \$82,100,000 was reported in total only by the fish processing and slaughtering and meat packing industries. The iron and steel group with \$697.5 million reported the highest inventory of any group. Foods and beverages with \$597.5 million came second, followed by paper products with \$338.5 million, transportation equipment \$325.2 million, nonferrous metal products \$276.8 million, electrical apparatus and supplies \$253.4 million, chemicals and allied products \$251.7 million, wood products \$243.5 million, products of petroleum and coal \$203.6 million, etc.

TABLE 25. Value of Manufacturing Inventory Held at Plant or Plant Warehouse, Exclusive of Goods Purchased for Resale Without Further Processing, 1949-571

¹ The opening inventory of the current year differs from the closing inventory of the previous year because of the receipt of revised data, the inclusion of new firms and the removal of figures for firms that did not operate during the current year.

² Revised.

³ Less than \$50,000

Less than \$50,000.

'The 'Fish processing' and 'Slaughtering and meat packing' industries could not report the three-way breakdown of their inventory. For this esson the three columns do not add to the total.

reason the three columns do not add to the total.

In sawmills in 1957 "Goods in process" includes rough sawn lumber which in 1956 was reported under "Finished products".

^{..} Not available.

Subsection 3. Employment in Manufacturing Industries

Monthly Record of Employment. — Ordinarily, manufacturing employment in Canada reaches its highest point during the summer months. Some of the seasonal industries, such as canning, are most active then, textile industries are preparing winter goods, and industry generally feels the active demand of the agricultural purchasing power resulting from the prospect of the season's harvest.

After the setback of 1929, employment in 1930, 1931, 1932 and the first half of 1933 declined steadily, the monthly employment figures in each case being lower than the corresponding month of the previous year. The peak of employment in June, 1929, when 575,693 production workers were on the payrolls, was surpassed in September, 1937, with 582,305 production workers. After the outbreak of war the improvement in employment became increasingly rapid. A record high was reached in August, 1943, when 1,067,890 production workers were employed, an increase of 96.4 p.c. over the same month in 1939. The highest employment during 1944 occurred in June when 1,049,557 production workers were employed. From then on employment declined steadily to the end of 1945 when 819,619 production workers were reported. At the end of 1951 there were 953,952 production workers employed, compared with an employment of 961,820 production workers in December, 1944, and 1,021,630 in December, 1943.

During the first half of 1952 the number of production workers increased each month, but not to the extent of the

employment in the same month of the previous year. From the middle of the year monthly employment figures exceeded those of the previous year. This trend continued to October 1953. The trend for the next two months was downward so that by the end of 1953 there were only 990,611 production workers as commared with 1.018.764 at the end of December 1952.

The minor recession experienced in 1954 is reflected in the monthly employment figures, the number employed each month being lower than the corresponding month of the previous year, although there was the usual upturn during the summer months. Employment at the end of December at 932,786 was at the lowest level since 1949 when 906,851 persons were employed. December 1952 with 1,018,764 production workers had the highest year-end figures during this period.

The downward trend of 1954 continued until the end of April 1955. From then on, the monthly employment figures were consistently higher than the corresponding months of the previous year. This upward trend continued until May 1957 when manufacturing activity began to decline. June and July saw a slight drop from the corresponding figures of the previous year. Some improvement took place in August, but from September on to the end of the year the monthly figures were consistently lower, so that the year-end employment in 1957 totalled only 963,228 as compared with 1,025,860 in 1956, a drop of 6.1 p.c. This compares with an increase of 3.3 p.c. in 1956 over 1955.

Subsection 4. Hours Worked in Manufacturing Industries

Hours Worked by Production Workers. - From 1932, the first year for which figures on hours worked per week by production workers are available, to 1945, each firm was required to report the number of hours worked by all its production workers during the month in which the greatest number had been employed, the only exception being the years 1938 and 1939 when one week in a month of normal employment was reported. In 1938 the number of hours worked per week were compiled by sex, and a change was also made in the analysis of the weekly hours worked. Since 1940 the hours worked per week include overtime while prior to that overtime was excluded. These changes make it impossible to measure accurately the changes in the number of hours worked per week. In any case, the figures in Table 29 do not refer to any particular month, since the month of highest employment might be May for one firm and October for another; they represent the summation of the different months of highest employment as reported by all firms. For a given industry, however, the month of highest employment is more significant as in this case it coincides for a great number of firms engaged in the same industry

For all production workers, the hours worked per week declined from 48.9 in 1932 to 47.2 in 1939, and reached 50.6 in 1941, some of the increase no doubt being due to the inclusion of overtime. Since then there was a counter movement in the hours worked, especially among females, due to the employment of many workers on a part-time basis. Whereas in 1939 there were only 2.8 p.c. of male and 5.3 p.c. of female production workers working under 30 hours per week, in 1944 these percentages rose to 5.3 and 12.5 respectively. Since the end of the war the normal working week has been dropping steadily. In 1945 average hours per week for male production workers totalled 47.6 and for females 42.7.

The method of collecting statistics on hours worked was changed in 1946. Instead of collecting this information for one week in the month of highest employment which varied from plant to plant, the last week of November was chosen for the base period. For 1948 and subsequent years the period was changed to the last week in October. The question on hours worked was taken out of the annual schedules used in connection with the census of manufactures and this information is now collected by the Employment Statistics Section. Establishments employing 15 hands or over only are covered. The statistics for 1946 to 1957 are, therefore, not exactly comparable with those for earlier years which include all establishments, both large and small.

On the above basis, the hours worked per week declined for all workers engaged in manufacturing. The hours of male production workers dropped from 44.9 in 1946 to 41.2 in 1957, female production workers from 40.0 to 37.7, male office employees from 42.0 to 39.0 and female office employees from 39.5 to 37.6

Persons employed in 1950, 1953 and 1956 were classified on the basis of earnings per week instead of hours worked. For this reason the distribution of employees by hours worked per week is not available for these years. It is the intention in future to classify employees one year on the basis of hours worked, the second year on the basis of weekly earnings, while in the third year no break-down of sither the hours worked or weekly earnings will be collected. Instead a more detailed break-down of salaried employees into (a) managerial and professional and (b) office workers will be requested.

Administrative and office employees as a rule work shorter hours than production workers as the following figures for 1957 indicate.

	Production workers	Supervisory and office employees
Both sexes	40.5	38.6
Male	41.2	39.0
Female	37.7	37.6

TABLE 29. Production Workers in Manufacturing, Working Specified Numbers of Hours per Week in the Month of Highest Employment, 1938-451

Note: Hours worked per week in 1934-37 are given at p. 393 of the 1942 edition of the Canada Year Book; in 1940 and 1941 at p. 392 of the 1943-44 edition.

¹ Classified statistics on hours worked since 1946 are taken from the annual report "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division of the Bureau. These statistics which are collected every third year cover establishments employing 15 hands or over only.

² Last week in November.

TABLE 31. Average Hours Worked per Week in the Manufacturing Industries of Canada, by Provinces, 1946-571 (Hours worked by wage-earners from 1938 to 1945 are given on page 53 of the 1950 General Review of the Manufacturing Industries of Canada)

¹ Statistics on hours worked since 1946 are taken from the annual report "Earnings and Houcs of Work in Manufacturing", compiled by the Employment Section of the Labour Division of the Bureau, These statistics cover establishments employing 15 hands or over only. For 1946 and 1947 they refer to the last week in October.

Subsection 5. Earnings in Manufacturing Industries

In 1957, the 37,875 establishments covered, employed 313,884 administrative and office employees and 1,045,177 production workers, a total of 1,359,061 persons. Out of every 1,000 persons employed in manufacturing, 231 were classed as office employees and 769 as production workers; the former earned 29 p.c. and the latter 71 p.c. of the total amount paid out as remuneration for services.

A notable feature during the past few years was the reduction in the disparity between average annual earnings of office and production workers. Whereas in 1939 average annual earnings of production workers were only 56 p.c. of that paid to office workers, in 1943 the percentage rose to 76, they declined to 69 in 1947 and rose to 73 in 1957. This tendency towards equalization was due, in part, to the controls

adopted by the Government during the war years which tended to stabilize earnings of office workers more so than the earnings of production workers. The increase in average earnings of production workers was also influenced by the fact that large numbers were employed in the highly paid iron and steel industries and by the increase in the number of hours worked, some at overtime pay,

Ontario has a larger proportion of females among its office employees than the other provinces. The same situation prevails in Quebec with regard to production workers, due, no doubt, to the textile industries of the Province. The importance of the textile industries in providing employment to females is strikingly illustrated by the fact that of all female production workers engaged in the manufacturing industries of Canada in 1957, 42 p.c. were found in the textile and clothing groups.

Average earnings of office workers in 1957 amounted to \$4.471 which was \$1,635 or 58 p.c. higher than in 1949. Office employees in Ontario with \$4,651 were the highest paid. Those

in British Columbia were second with \$4,576, Quebec third with \$4,407, Alberta fourth with \$4,033 and Manitoba fifth with \$3,965. The fact that head offices of many large corporations are located in Montreal, Toronto, Winnipeg and Vancouver tends to raise the average salary of the provinces in which these cities are located.

Average earnings of production workers in 1957 amounted to \$3,269 which was \$1,202 or 58 p.c. higher than in 1949. The manufacturing industries of British Columbia paid the highest average annual wages of \$3,647. Ontario with \$3,483 was in second place, followed by Alberta with \$3,334, Saskatchewan \$3,312, Newfoundland \$3,159, Manitoba \$2,986, Quebec \$2,973. etc. The high figure shown for Yukon and Northwest Territories in regard to average earnings of production workers is due to the unusual conditions under which industry is carried on in these regions, and is not representative. Statistics of the distribution of employees by provinces and industrial groups as well as average annual earnings are given in Table 33.

¹ The increase in the number of office employees in 1931 is due to the following changes in method: 1. Prior to 1931 working proprietors, such as bakers, sawmill operators, small clothing manufacturers, etc., were required to report themselves as production workers. In 1931 and subsequent years, however, all such proprietors reported themselves as office employees. 2. In 1931 travelling salesmen who were attached to the plant, and devoted all or the greater part of their time to selling the products of that plant, were included with office employees. Prior to this they were not

² The averages of the number of production workers and earnings for the years 1931 to 1957 are strictly comparable with those for the years up to 1925 but not with those for the intervening years. The figures for the latest years—as for the earliest—represent the earnings for complete manylars of work, with no allowance for periods of unemployment. The difference amounts only to about 3 or 4 p.c. in the total figures and affects chiefly the seasonal industries.

Average Annual Earnings in the Forty Leading Industries — Variations in average earnings are related to the number of employees in industries or areas where pay levels are above or below the average because of differences in basic pay rates, in sex and occupational distributions, in amounts of bonus or commission payments, levels of activity, etc. The earnings of salaried men are substantially higher, on the average, than those of other categories, mainly because their numbers include relatively highly-paid managerial and professional workers. Women's earnings are generally well below those of men in the same industry, chiefly as a result of pay differentials, occupational differences, the greater incidence of part-time work and absenteeism among women, and their higher proportions of younger and less experienced workers.

In 1957 there were ten industries paying office workers \$5,000 or over, as compared with none in 1951. Indicative of the rapidly changing pattern of remuneration in manufacturing is the fact that in 1945, the last year of the war, no industry paid office workers annual salaries of over \$3,000. The highest average earnings in that year were \$2,935 reported by the brewing industry. Highest average earnings in 1957, amounting to \$6,121 were received by the administrative and office employees of the pulp and paper industry which has held the premier position for a number of years. This is the first time that an industry averaged over \$6,000 in annual earnings.

Primary iron and steel with \$5,723, breweries \$5,633, petroleum products \$5,592, non-ferrous metal smelting and refining \$5,439, acids, alkalies and salts \$5,318, motor vehicles \$5,287, bridge and structural steel \$5,223, motor vehicle parts \$5,109, and railway rolling stock \$5,025 were the other industries with \$5,000 and over. There were thirteen other industries with average salaries of \$4,500 to \$5,000, ten with salaries of \$4,000 to \$4,000, six with salaries of \$3,000 to \$4,000, and only one, viz. sawmills with salaries below \$3,000. Average salaries in the forty leading industries totalled \$4,568 as compared with \$4,256 for the smaller industries. This lower average is due in part to a higher proportion of female office employees in the smaller industries. In the forty leading industries 26 p.c. of the office employees were female while in the smaller industries 33 p.c. were in this category.

The increase in the average earnings of production workers since 1945 paralleled that of administrative and office employees. Whereas in 1945 there were only four industries averaging over \$2,000, in 1957 none of the forty leading industries averaged below this figure. In 1945 the highest annual earnings, amounting to \$2,365, were paid by the motor vehicle industry, while in 1957 the highest earnings which totalled \$4,866 were paid by the petroleum products industry. This industry which was in first place for a number of years was displaced by the primary iron and steel industry in 1956.

The highest earnings are usually paid by industries in which the proportion of skilled workers is high, and the proportion of female workers is low. Ten industries in 1957 had average annual earnings of \$4,000 or more. These were: petroleum products \$4,866, primary iron and steel \$4,577, acids, alkalies and salts \$4,400, pulp and paper \$4,358, non-ferrous metal smelting and refining \$4,353, bridge and structural steel work \$4,221, breweries \$4,027, printing and publishing \$4,017, motor vehicles \$4,011, and boilers, tank and plate work \$4,011. In thirteen other industries average annual earnings ranged between \$3,500 and \$4,000, in twelve they were below \$2,500 and \$3,500 while in the remaining five they were below

\$2,500. This last group includes industries made up of a large number of small establishments and in which the proportion of female workers is high. Cotton yarn and cloth with \$2,456, women's factory clothing \$2,194, leather footwear \$2,183, fruit and vegetable preparations \$2,140, and men's factory clothing \$2,083 are the industries in this category. Average annual earnings of production workers in the forty leading industries amounted to \$3,446 as compared with \$2,878 for the smaller industries. The lower average for the smaller industries is due mainly to a higher proportion of female workers. Employment by sex, and average annual earnings in the forty leading industries are given in Table 34.

Average Annual, Weekly and Hourly Earnings. - Statistics employment and earnings are compiled in two separate divisions of the Bureau, viz. the Industry and Merchandising Division and the Labour Division. The Industry and Merchandising Division collects from every manufacturer once a year details of the number of persons employed and total payments made during the calendar year, classified by sex. This data is also classified into (a) administrative and office employees and (b) production and related workers. The office employees reported is the average for the year, while in the case of production workers manufacturers report the number of workers receiving pay during the last pay period of each month and the monthly average is calculated in the Bureau. We thus have statistics on employment broken down by sex with separate figures on the amounts paid to (a) administrative and office employees referred to as Office Employees and (b) production and related workers referred to as Production Workers. Average annual earnings, not broken down by sex, are, therefore, available for these two classes of employees.

Statistics on weekly and hourly earnings as well as hours worked per week are compiled by the Employment Section of the Labour Division. In addition to the monthly surveys on employment, payrolls and man-hours which covers all sectors of the economy, there is an annual survey on earnings and hours worked in the last week of October, covering the larger manufacturing establishments. Each year statistics of earnings and hours of male and female wage-earners and salaried employees are obtained, with additional detail collected in a three-year cycle since 1949. In 1956, as in 1953 and 1950, a distribution of wage-earners and salaried employees by amounts earned in the survey week was made. The first two inquiries had required distributions in \$5 intervals to \$60 per week, in \$10 intervals thereafter, with an upper class of \$100 and over while the 1956 survey called for distributions in \$10 intervals to \$150 a week. In 1955, a distribution of wage-earners in a given range of hours was obtained while, in 1954, information for office and clerical workers was segregated from that for managerial, professional and other salaried personnel. The annual and monthly surveys cover establishments usually employing 15 or more persons and include almost 90 p.c. of all employees in manufacturing as reported to the Annual Census of Manufactures.

Establishments co-operating in the annual surveys are asked to furnish material for all full-time, casual and part-time employees receiving pay in the last week in October, except home-workers. Proprietors, firm members, pensioners, and staffs of separately-organized sales offices are excluded. Establishments closed in the week because of labour disputes usually report for the nearest week of operation. Men and women are grouped as (1) wage-earners, defined generally as production workers, including working foremen, route-drivers, shipping and maintenance staffs, and related employees, and (2) salaried employees, comprising general office and clerical workers in the office and plant, executive, administrative and professional personnel, and travelling salesmen directly responsible to the plant administration. Hours and earnings in the week are required for workers of both sexes in each category.

The reported hours include full-time, short-time and overtime hours worked and any hours of paid absence in the week. The earnings cover the gross payrolls before deductions for taxes, unemployment insurance contributions, etc., including time, piece-work and commission earnings, regularly-paid incentive, cost-of-living and other bonuses, overtime earnings, and payments to persons absent with pay during the survey week.

While establishments differ to some extent in their classification of certain categories of employees, the proportions of salaried employees in the various industries and areas are generally related to the type and scale of operations. Where plants are typically small, as in Saskatchewan, proprietors and firm members (excluded from the surveys) frequently undertake managerial and office duties that in larger establishments require substantial staffs. On the other hand, large and multiple plant organizations and those requiring many professional workers, such as printing and publishing, employ above-average proportions of salaried personnel. Where travelling salesmen and associated office workers appear on the plant payroll, salaried workers are relatively more numerous than where

separate sales offices are maintained. The proportions of employees reported as salaried staff and as wage-earners are affected by seasonal and market conditions and by other factors contributing to variations in production levels, which usually cause sharper fluctuations in numbers of wage-earners than of salaried employees.

Inter-industry and area variations in hours, as well as year-to-year changes, result from a variety of causes. These include (1) the length of the standard work week, (2) the number of casual and part-time workers and the hours they worked in the reported week, (3) amounts of overtime worked, and of time lost through absenteeism, labour turnover, industrial disputes, lay-offs, etc., (4) differing occupational requirements, and (5) varying proportions of men and women. Women generally average substantially less time than men. Their standard work week tends to be shorter, relatively small proportions of women are employed in industries where the work week is above-average, and they have a higher incidence of part-time work and of absenteeism.

Differences in average earnings are related to the distributions of employees in industries or areas where pay levels vary from the average because of variations in basic pay rates, in sex and occupational distributions, in amounts of bonus or commission payments, in levels of activity, etc. The earnings of salaried men are substantially higher, on the average, than those of other categories, mainly because their numbers include relatively highly-paid managerial and professional workers. Women's earnings are generally well below those of men in the same industries, chiefly as a result of pay differentials, occupational differences, the greater incidence of part-time work and absenteeism among women, and their higher proportions of younger and less experienced workers.

There are a few minor differences in the coverage and wording used by the two divisions. The terms "administrative and office employees" and "production and related workers" used by the Industry and Merchandising Division in its annual survey of manufactures corresponds more or less to the terms "salaried employees" and "wage-earners" used by the Employment Section of the Labour Division. There are, however, two minor differences in the two surveys. The Industry and Merchandising Division includes working proprietors with office employees while the Labour Division excludes them from their surveys. In the case of travelling salesmen attached to the plant the Labour Division includes them with salaried employees while the Ludstry and Merchandising Division does not consider them as being employed in manufacturing.

Prior to 1946 statistics on weekly and hourly earnings as well as hours worked by production workers were collected by the Industry and Merchandising Division in the annual survey of manufactures. Since then this phase of the work was taken over by the Employment Section of the Labour Division and was also expanded to include office employees.

The figures for the years 1934 to 1945 given in Table 35 are based on an analysis of a pay-list covering one week in the month of highest employment. For this reason the figures do not refer to any particular month, since the month of highest employment might be May for one firm and October for another; they represent the summation of the different months of highest employment as reported by all the firms. For a particular industry, however, the month of highest employment is more significant as in such a case it coincides for a great number of firms engaged in the same industry. The figures since 1946 are based on returns received from establishments employing 15 hands or over, and for 1946 and 1947 they refer to the last week in the month of November, whereas for 1948-1957 they refer to the last week in the month of October.

As mentioned above, average annual earnings in manufacturing, classified by sex, are not directly available. To calculate annual earnings by sex, the weekly earnings compiled by the Employment Section are correlated with the employment and payroll data obtained by the annual survey of manufactures. The following example will illustrate the method that is used.

In 1949 the paper products group, according to the annual census of industry, reported 9,077 male and 3,573 female office employees with total payments of \$46,537,336. From

the October survey on weekly earnings this group showed \$77.41 per week for male and \$34.88 per week for female office employees. The proportion of female to male earnings is therefore .451 \$34.88 Female employees are first reduced to a male basis and the calculation is then as follows:

Annual Earnings of Male Employees

$$\frac{\$46,537,336}{9,077+.451(3,573)} = \frac{\$46,537,336}{10,688} = \$4,354$$

Annual Earnings of Female Employees

In the foregoing calculation the assumption is made that annual earnings of male and female employees vary in the same proportion as their weekly earnings. In the above illustration it may also be noted that the calculated annual earnings for male employees amounting to \$4,354 are higher than the weekly earnings multiplied by 52 which total only \$4,025 ($\77.41×52). This difference is due to the fact that the earnings reported to the Census of Manufactures include payments to executives as well as bonuses to employees which are usually paid at the end of the year, while the earnings reported for the one week in the year exclude such payments.

Average Annual, Weekly and Hourly Earnings of Production Workers. — Average weekly earnings of male production workers for manufacturing as a whole amounted to \$72.21 in 1957, an

increase of \$24.88 or 53 p.c. as compared with 1949. Average hourly earnings advanced from \$1.07 in 1949 to \$1.75 in 1957, an increase of 64 p.c.; while annual earnings at \$3,609 were 58 p.c. higher. There are wide regional and industrial variations in hourly earnings. British Columbia is the highest paying province, hourly earnings for male production workers being \$2.01 in 1957 as compared with \$1.75 for Canada as a whole. Ontario with \$1.84 was second while Prince Edward Island with \$1.13 was the lowest. On an industrial basis, male production workers in the products of petroleum and coal group of industries were the highest paid with an hourly average of \$2.24, while the leather group was the lowest with \$1.31.

Female production workers received on an average \$39.49 per week in 1957, an increase of \$12.31 or 45 p.c. since 1949. Hourly earnings at \$1.05 were 54 p.c. higher, while annual earnings at \$1,974 were 50 p.c. higher. In the case of females, British Columbia with \$1.30 per hour was also the highest paying province, while Newfoundland with 59 cents was the lowest. The transportation equipment and tobacco products groups with \$1.46 per hour paid the highest wages to its female production workers, while the leather products group had the lowest at 89 cents per hour. The leather products group had the lowest hourly earnings for both male and female production workers.

The following table gives the weekly and hourly earnings of male and female production workers for each province and major industrial group for the year 1957.

Average Weekly and Hourly Earnings of Male and Female Production Workers, by Provinces and Industrial Groups, 1957

TABLE 35. Average Annual, Weekly and Hourly Earnings of Production Workers, Employed in the Manufacturing Industries, 1934-571

Note: Butter and cheese factories and fish curing and packing plants are excluded in the years 1938 to 1945, while sawmills are also excluded in 1945. By including sawmills, weekly earnings in 1945 would have been about \$34.35 for male wage-earners.

¹ Statistics on weekly and hourly earnings are taken from the annual report "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division of the Bureau, These statistics cover establishments employing 15 hands or over. For 1946 and 1947 they refer to the last week in November and for 1948 to 1957 to the last week in October, Annual earnings are calculated, See text on pages 84 and 85.

² Estimated on the basis of hours worked by female workers in 1938 and 1939 as compared with those worked by male workers in these years.

¹ The average annual earnings are calculated on the basis of the total amount paid during the year as reported to census of industry, while the weekly earnings are based on an analysis of the pay-list for the last week in October and only cover establishments employing 15 hands or over, The drop in the average annual earnings is due in part to these factors as well as to the fact that in 1951 statistics for the processing of fish in Newfoundland were included with manufacturers for the first time. As this is a seasonal industry annual earnings are, therefore, lower, in 1951 average annual earnings of production workers for both sexes for this industry averaged \$1.151 as compared with \$2,806 for the other industries of the province. province.

Average Annual, Weekly and Hourly Earnings of Administrative and Office Employees. — Annual earnings of male office employees in 1957 averaged \$5,205, weekly earnings \$104.63 and hourly earnings \$2.68. For female office employees annual earnings averaged \$2,576, weekly earnings \$51.84 and hourly earnings \$1.38. Average annual earnings of all office employees totalled \$4,471 in 1957, an increase of 58 p.c. since 1949. Weekly earnings at \$89.92 were 64 p.c. higher and hourly earnings at \$2.33 were 70 p.c. higher. There were ten groups with average weekly earnings for male office employees of \$100

or more. Products of petroleum and coal with \$134.46 per week paid the highest salaries. Paper products with \$124.63 came second, followed by non-ferrous metal smelting and refining with \$113.43, tobacco and tobacco products \$112.78, chemicals and allied products \$109.75, transportation equipment \$107.45, iron and steel products \$104.50, electrical apparatus and supplies \$103.91, non-metallic mineral products \$102.27, and miscellaneous industries \$100.92. The leather products group paid the lowest salaries of \$88.85. In the case of female office employees there were nine groups with average weekly salaries

of \$50 or more. Female employees in the tobacco and tobacco products group received the highest salary of \$63.24, displacing the products of petroleum and coal group which was in first place in 1956. In second place in 1957 was the products of petroleum and coal group with \$62.30, followed by paper products with \$56.60, transportation equipment \$55.81, chemicals and allied products \$55.68, non-ferrous metal products

\$53.40, electrical apparatus and supplies \$52.92, non-metallic mineral products \$51.74 and iron and steel products \$51.37. In the case of females, too, the leather products group had the lowest weekly salary of \$44.03.

The following table gives weekly and hourly earnings of male and female office employees for each province and major

industrial group for the year 1957.

¹ Statistics on weekly and hourly earnings are taken from the annual report "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division of the bureau, These statistics sover establishments employing 15 hands or over. For 1946 and 1947 they refer to the last week in November and ** 948 to 1957 to the last week in October. Annual earnings are calculated, See text on pages 84 and 85.

Office Workers and Other Salaried Employees.—A survey of weekly earnings of administrative and office employees, classified into (a) managerial and professional employees and (b) office workers, was undertaken for the first time in 1951 and repeated again in 1954 and 1957. According to Table 41 below average weekly salaries of all office and supervisory employees in 1957 averaged \$89.92. Male employees received \$104.63 and female employees \$51.84. The increase per week since 1951 for all employees totalled \$23.94, for males \$27.08 and for females \$13.42.

The average weekly salary for office workers rose in the six years from \$51.14 to \$67.98, an advance of 32.9 p.c. as compared with 36.3 p.c. for all salaried employees. The average for men classed in the office group increased by \$20.40 to \$81.08 and for women by \$13.03 to \$50.80, representing an advance of 33.6 p.c. and 34.5 p.c. respectively. The upward movement was more pronounced in the durable goods division than in non-durables. Higher earnings for office workers were

reported in 1957 as compared with 1954 in all provinces and industry groups.

The residual group of salaried employees, composed mainly of managerial, professional and related staffs and professional salesmen, comprises a varied group, the composition of which may differ from firm to firm. Its components are affected not only by varying requirements for administrative and professional personnel but also by the extent to which proprietors and firm members (excluded from the survey) undertake such duties, and by the organization of separate sales offices. The managerial and professional employees reported in 1951 averaged \$98.38 per week, the men earned \$99.73 and the women \$57.04. Six years later the averages were \$124.53 for both sexes, \$126.47 for men and \$72.24 for women. All industry groups and provinces reported higher earnings in 1957 as compared with 1954, raising the average salary for both sexes in the managerial and professional group to more than \$100 per week in all provinces and major industrial groups.

¹ Taken from the annual reports "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division.

The term "Administrative and Office Employees" as used by the annual survey of manufactures corresponds to the term "Salaried Employees" used by the Employment Section of the Labour Division.

Distribution of Employees on the Basis of Weekly Earnings. — Prior to 1950 statistics on the distribution of employees on the basis of weekly earnings were compiled by the Industry and Merchandising Division in the annual census of manufactures. At first only wage-earners were covered and in 1944 salaried employees were also included. In 1946 this phase of manufacturing statistics was transferred to the Employment Section of the Labour Division. The 1950 survey which covered the last pay period in October made available data on the distribution of employees by earnings groups for the first time since

the Census of Manufactures survey in January 1944. The data in the two surveys are not strictly comparable, largely because the earlier surveys included establishments employing less than 15 persons and were conducted for a different period of the year. Also the 1944 survey reflected wartime conditions.

Variation in the provincial distribution of employees by amounts earned are obviously related to pay levels, occupational and sex differences, number of casual and part-time workers, and length of the working week in the more important

⁻⁻ Number too small to be significant.

industries in each area. Most of the employees in the low-earnings ranges are casually-employed workers, or those who do not work full time in the week. Part-time work is particularly common among women; the 1952 survey showed that 11.9 p.c. of the female production workers reported in manufacturing worked 30 hours or less, as compared with 4.6 p.c. for men. Short-time or casual work is characteristic of such industries as fish processing and fruit and vegetable canning, the duration of employment depending on the immediate availability of materials.

The tremendous change in the level of incomes of factory workers since the war is strikingly illustrated in Table 42. Whereas in 1940 only 3 p.c. of male and none of the female production workers received \$50 or more per week, in 1956 these percentages jumped to 85 and 24 respectively. The

percentage of employees in the lower income groups declined accordingly. Whereas in 1940, 72 p.c. of male production workers received less than \$30 per week, in 1956 the percentage declined to 3. For female production workers the percentage in these groups declined from 99 to 28.

For office workers information on the distribution by income groups is only available for 1944, 1950, 1953 and 1956. Earnings by office workers, too, advanced to unprecedented heights. The percentage of male office workers receiving \$50 or more per week rose to 92 in 1956 from 39 in 1944, while for females the percentage in 1956 was 46 as compared with none in 1944. Tables 43 and 44 give the distribution by income groups of male and female production workers as well as office workers by provinces and major industrial groups for 1956.

¹ Statistics for 1950, 1953 and 1956 are taken from the annual reports "Earnings and Hours of Work in Manufacturing", compiled by the Employment Section of the Labour Division. The terms "wage-earners" and "salaried employees" in the above table correspond to the terms "production and related workers" and "administrative and office" employees in the annual survey of manufactures.

² And over.

Real Earnings of Employees in Recent Years. — When the index number representing the average yearly earnings of production workers is divided by the consumer price index, on the same base, a measure of "real" income is obtained. Index numbers for 1931 to 1957 are given in Table 45. In 1933,

the height of the depression, real earnings were 63.9 on the 1949 base. From then on they rose steadily and stood at 101.5 in 1944, an increase of about 59 p.c. In 1946 real earnings dropped to 94.6 and from then on continued to rise each year. In 1957 the index stood at 129.8.

Percentage of Salaries and Wages to Net Value of Products. — Table 46 shows the relation between salaries and wages paid by manufacturers and the total net value of production or value added by manufacture. Figures of gross production are often used in such calculations, but the values out of which the wages of employees must come in the long run are the values added to the raw materials while they are in the factory. Such added values constitute the real production

of the manufacturing plant and are alone available for payment of salaries and wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met.

The percentage of salaries or payments to office workers fluctuate more widely than payments to production workers and has steadily been increasing during the past decade from a low of 10.8 in 1948 to a high of 14.3 in 1957. There was only one

year, viz. 1933, when the percentage was higher than 14.3. The high percentage of 15.1 in 1933 was due to the sharp decline in manufacturing production which was unaccompanied by a corresponding decline in office employment.

The increasing percentage of salaries to value added is due in part to the inclusion of professional and technical employees with salaried workers. With the rapid expansion in manufacturing production during the past decade this type of employment has been increasing rapidly. There is also another factor in the relatively larger increase in office employees. As firms increase in size there is a tendency to perform more and more functions themselves, functions which in the case of smaller firms are performed by independent specialist firms outside the manufacturing field. For example, a firm when it gets larger might decide to do its own selling instead of selling through wholesalers. So without increasing the number of production workers, the office staff would automatically be increased, since now it will include a sales manager and additional clerks for the extra work involved. Other functions such as research, advertising, etc. are increasingly being done

by a firm's own staff which tends to increase the number of administrative and office employees in manufacturing without a corresponding increase in the number of wage-earners or production workers.

Production workers on the other hand can be more readily adjusted to the fluctuations in manufacturing activity and wage levels likewise may be more readily adjusted to the price levels of products, so that the percentage of earnings of production workers to value added has a narrower range than that of office workers. In this case the percentage ranged from a high of 38.0 in 1948 to a low of 34.2 in 1955. In contrast to the percentage of salaries paid to value added which has been increasing during the past decade, the percentage payments to production workers has been declining during the same period. There was an increase of 58.3 p.c. in the number of administrative and office employees as compared with an increase of only 9.2 p.c. for production workers during the period 1948-57. Of the increase in the value added by manufacture since 1948 amounting to \$4,883,297,740, \$2,410,259,809 or 49.4 p.c. was passed along in increased salaries and wages.

¹ Equivalent to "net value of products", see footnote 1, Table 1.

Subsection 6. Size of Manufacturing Establishments

The size of the manufacturing establishment is generally measured either by the value of product or by the number of employees, but each of these methods has its limitations. The latter takes no account of the differences in capital equipment at different times or in various industries and obviously the increased use of machinery, as in the flour-milling industry, may lead to an increase in production concurrently with a decrease in number of employees. The former measure has to be adjusted for changes in the price level and, as between industries, it makes those in which the cost of raw materials is relatively high appear to operate on a larger scale.

Size as Measured by Gross Value of Products. — While in 1922 the 420 establishments each producing over \$1,000,000 had an aggregate value of products of \$1,268,056,129 or 51 p.c. of the total production of all manufacturing industries, the 719 establishments producing over \$1,000,000 each in 1929

had an aggregate value of products of \$2,516,064,954, or 62 p.c. of the grand total for all manufacturing establishments - a very significant change in the short period of eight years. In 1931, however, the number of plants with a production of over \$1,000,000 dropped again to 482, their output being valued at \$1,451,658,954, or 53 p.c. of the total. With the increased production resulting from war needs, the number of plants with a production of \$1,000,000 or over jumped to 1,376 in 1944 and their output was about 75 p.c. of the total value of manufactures. With the end of the war and the consequent decline in production of the huge war plants the number of establishments with a production of \$1,000,000 or over, although increasing to 1,442 in 1946, nevertheless saw a decline in the proportion of their output to 67 p.c. of the total. With increased prices and an expansion in the physical volume of production during 1947 to 1957, establishments with a production of \$1,000,000 or over increased to 3,053 while their contribution to the total output rose to 81 p.c.

¹ Under this heading are included only those head offices that are not located at the plant.

Size as Measured by Number of Employees. — In 1929, establishments employing 501 hands or over accounted for 27.3 p.c. of the number of employees engaged in manufacturing. The tendency then in evidence of increasing concentration into larger units was checked by the depression, the percentage dropping to 20.5 in 1933, (central electric stations included), but rising again to 25.6 in 1939. The same holds true for establishments employing 101 hands or over. In 1929 they employed 61.9 p.c., in 1933, 55.7 p.c. and in 1939, 61.5 p.c.

The effect of the War on the concentration of industries into large units is illustrated by the increase in the number of establishments employing 500 hands or over. In 1939 such establishments numbered 172 and employed 25.6 p.c. of the total number of employees engaged in manufacturing. By 1944 the number had increased to 383 and the percentage of total employees to 47.0. In a further subdivision of this group in 1944 it was found that 226 establishments employed between 500 and 999 persons, 56 between 1,000 and 1,499, and 101 employed over 1,500. Altogether there were 12 plants employing over 7,000 persons, the largest having an employment of a

little over 13,000 with the next three largest employing between 9,000 and 10,000. Three other plants employed between 8,000 and 9,000 persons, while the lowest five plants in this group employed between 7,000 and 8,000 workers.

With the resumption of peace-time production the larger establishments declined in size so that by 1957 only 66 establishments employed over 1,500 persons, as compared with 101 in 1944. In 1957 there were only twelve establishments with 5,000 or more employees. Two of these reported over 10,000 employees, three between 8,000 and 10,000, and the remaining seven between 5,000 and 8,000.

Size of Establishment in Leading Industries. - Table 53 summarizes the degree of concentration in some of the leading industries of Canada. Concentration is extremely marked in the case of motor vehicles, non-ferrous metal smelting and refining, railway rolling-stock, cotton yarn and cloth, primary iron and steel, pulp and paper, and heavy electrical machinery; whereas in the case of women's factory clothing, miscellaneous food preparations, furniture, butter and cheese, bread and other bakery products, fruit and vegetable preparations, sawmills and men's factory clothing, the degree of concentration is low. This concentration is analysed in detail for each of the twentyfive leading industries in the tables following.

TABLE 53. Percentage Importance of Establishments, each Employing 200 or more Persons in the Twenty-Five Leading Industries, 1957.

No.	Industry .	Number of such establishments	Percentage of total number in the industry	Percentage of total shipments in the industry

Subsection 7. Fuel and Power Consumption

Cost of Fuel and Electricity.—Fuel is used quite generally throughout the industrial field for the generation of power by means of steam and internal combustion engines. It is also used for the heating of plants, and for providing the heat necessary to some manufacturing processes. The most important industries where heat is applied to the materials to facilitate or accomplish the desired transformation are foundries and machine shops, brick, tile, lime, and cement-making, petroleum refining, the glass industry, distilleries, food preparation, rubber goods, etc. Fuel used for such heating purposes, as well as for power, is included in the figures of Table 55. In addition to the electricity used for ordinary power purposes, the figures include also the electricity used for heating bollers in the pulp and paper industry. Consumption of surplus energy in electric boilers increased rapidly during the years preceding the Second World War.

The figures of the table do not include coke charged to iron-blast furnaces or foundry cupolas. Neither do they include foal that constitute the raw materials to be transformed, as coal in the coke and gas industries and crude petroleum in the refining industry.

The value of purchased fuel consumed increased 523 p.c. from 1939 to 1957. Part of the increase was due to an increase in the quantity used and part to the rise in the unit cost of fuels of all kinds. The cost of electricity purchased, on the other hand, has increased during the same period by 296 p.c. The groups of industries in which fuel was most extensively used in 1957 were: paper products, products of petroleum and coal, foods and beverages, iron and steel products, non-metallic mineral products, non-ferrous metal products and chemicals and allied products.

Of the total cost of purchased fuel and electricity for Canada as a whole in 1957, 64.0 p.c. was for fuel and 36.0 for electricity. Percentagewise, Nova Scotia with 79.3 p.c. of the Provincial total was the largest user of fuel, while Quebec with 56.3 p.c. was the smallest. Provinces lacking in water power resources naturally have to rely on fuel for power, and for this reason the percentage that fuel is to the total is much higher than in Provinces such as Quebec where there is an abundant supply of water for Power purposes. In the Provinces of Prince Edward Island, Nova Scotia, New Brunswick, Saskatchewan, and Alberta, primary power produced from fuels is an important factor in power utilization

Power Consumption.—Power equipment installed in manufacturing establishments is a very good barometer of the industrial development of Canada, inasmuch as production is increasingly dependent on power equipment. Increases and decreases in productive capacity, measured in horse-power, are not the result of temporary fluctuations in cost and values in the same manner as capital investments, values of products.

etc. Of course, power equipment installed is not a measure of the actual utilization of power for there is generally an excess over actual requirements, i.e., over power equipment in operation. Producers must have an installed operating margin in excess of normal requirements to provide for booming business conditions or breakdown of part of the plant. In times of depression this margin increases. During short periods of expanded production, the number of horse-power per wage-earner tends to decrease in view of the fact power equipment is not immediately increased, the expanded production being secured through overtime work or an increase in the number of shifts worked

Of the total increase in power equipment employed in manufacturing industries between 1939 and 1953, 75 p.c. was in electric motors operated by power purchased from central electric stations. However, some sections of Canada are not well provided with water power and in such sections primary power derived from steam engines or turbines, and internal combustion engines - which include all gasoline engines, gas engines (natural, coal, and producer gas), and compressionignition engines - also has increased rapidly during the period covered. During the period 1989-1953 there was an increase of 31 p.c. in the capacity of hydraulic turbines and water wheels, 56 p.c. in the capacity of steam engines and steam turbines, 115 p.c. in the capacity of electric motors, while internal combustion engines increased more than fivefold. The collection of statistics on power equipment was discontinued in 1949, but was collected again for 1953.

Power consumed by the manufacturing industries, purchased power as well as power generated for own use, totalled 48.1 billion kwh. in 1957, an increase of 148 p.c. as compared with 1939. Of the total consumed Quebec used 47.9 p.c., Ontario 27.9 p.c., British Columbia 15.1 p.c., Newfoundland and New Brunswick 1.9 p.c., Manitoba 1.7 p.c., and Alberta 1.6 p.c.

The paper products group with 33.8 p.c. of the total was the largest user of electric power in 1957, displacing the non-ferrous metal products group which held the premier position the preceding few years. The paper products group is also the largest user of purchased fuel and electricity. The non-ferrous metal products group was the second largest user of electric power in 1957 with 31.2 p.c. of the total, followed by chemicals and allied products with 10.1 p.c., iron and steel products 7.2 p.c., non-metallic mineral products 4.9 p.c., foods and beverages 3.0 p.c., etc.

Table 55 gives details of purchased fuel and electricity as well as the kwh. consumption by industrial groups and provinces. Table 56 gives details of power equipment and Tables 57 and 58 give details of fuel consumption for selected years from 1926 to 1957.

Chemicals and affect products						

¹ Since 1954 electricity previously reported as ''Generated for own use'' in the Fertilizer Industry in British Columbia, has been treated as ''Electricity purchased''. Of the total ''Generated for own use and for sale'', approximately 1,905,000 M kwh. were generated by thermal plant and 4,790,000 M kwh. by hydro-electric plant.

TABLE 56. Power Equipment Installed in the Manufacturing Industries of Canada, 1926-48, with Details by Provinces and Industrial Groups, 1953

with Decams by Flowinces and industrial Groups, 1953										
Year and province or group	Steam engines and turbines	Internal combustion engines	Hydraulic turbines and water wheels	Total	Electric motors operated by purchased power	Total power equipment	Electric motors operated by power generated by estab- lishments reporting	Total electric motors

¹ Exclusive of the Butter and Cheese industry in the province of Quebec in 1953.
² Not collected.
³ Includes manufactured and natural.
⁴ For 1926, 1929 and 1933, fuel and electricity used by "Dyeing, cleaning and laundry work" and by "Central electric stations" have been deducted from the totals in order to make the series comparable with current data.

TABLE 57. Values of Fuel and Electricity Consumed in the Manufacturing Industries for Selected Years 1926-1956 and by Province and Industrial Group, 1957

Reference Fuel oil Wood Liquified petroleum Matural Other fuel Total cost of fuel Total cost of fuel Purchased Generated for sale	No. 1 2 3 4 5 6 7

For 1926, 1929 and 1933, fuel and electricity used by "Dyeing, cleaning and laundry work" and by "Central electric stations" have been deducted from the totals already published in order to make the series comparable with current data.

* Electricity purchased for metallurgical purposes in the Non-ferrous Metal Smelting and Refining is included for the first time.

* Newfoundland included.

* Included in total.

PART II. PROVINCIAL AND LOCAL DISTRIBUTION OF MANUFACTURING PRODUCTION

SECTION 1. TYPE AND CONCENTRATION OF MANUFACTURING PRODUCTION

This part of the Report is introduced by a general analysis of the concentration of the manufacturing industries in the provinces. In the sections that follow, the principal features of the manufactures of each province are brought out and finally the distribution of manufacturing throughout the principal cities and towns of Canada is shown.

Ontario and Quebec are by far the most important manufacturing provinces of Canada. Their combined production in 1957 amounted to \$17,758,187,739 or 80 p.c. of the total gross value of manufactured products. The proximity of Ontario to the coal-fields of Pennsylvania, the water power and other varied resources of the provinces, and their nearness to the larger

markets of Canada and the United States have all contributed to this progress.

Table 1 shows the outstanding predominance of Ontario and Quebec in each industrial group. Quebec leads in the manufacture of tobacco and tobacco products, textiles (except clothing), clothing (textile and fur), and paper products. In each of the other groups Ontario has the greater production of the two provinces. In the production of wood products British Columbia with 39 p.c. of the total holds the dominant position, outranking both Ontario and Quebec which account respectively for 26 and 23 p.c. of the total. In each of the other groups Ontario and Quebec lead by a wide margin.

TABLE 1. Summary Statistics of Manufactures of Each Province, Classified by Industrial Groups, 1957

Province and group	Estab- lish- ments	Em- ployees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments

	22	166	657,765	1,627,311	1,409,691	3,221,268

¹ Confidential, Included with miscellaneous industries,
² Publication of these figures is authorized by the firms concerned.
³ Includes all groups marked
⁴ Included in "All other groups",
⁵ Includes printing and publishing, sheet metal products, jewellery and silverware, petroleum products, and acids, alkalies and salts.

The degree of concentration of manufacturing in large units is illustrated in Table 2. In Ontario 40.0 p.c. of all persons engaged in manufacturing were employed in establishments having 500 or more employees as compared with 36.7 p.c. for Canada as a whole. Ontario assumed the premier position in 1956, displacing Newfoundland which formerly ranked first. Quebec ranked second with 38.2 p.c., followed by Newfoundland with 32.6 p.c., Nova Scotia 32.2 p.c., New Brunswick 28.9 p.c. and British Columbia 28.3 p.c. There were no plants in either Prince Edward Island or Saskatchewan employing 500 or more persons.

TABLE 2. Concentration of Manufacturing Production in Each Province, 1957

SECTION 2. THE MANUFACTURES OF THE ATLANTIC PROVINCES

The Atlantic Provinces are of economic importance in a number of fields, such as pulp and paper, fish processing, sawmills and primary iron and steel. In Newfoundland manufacturing production is dominated by the forest and fisheries resources. Pulp and paper was the most important industry in 1957 with shipments valued at \$63,302,987, followed by fish processing with \$16,408,800. These two industries accounted for 68 per cent of the total production of the Province. In Prince Edward Island agriculture and fishing resources make butter and cheese, slaughtering and meat packing, and fish processing the leading industries. Nova Scotia is renowned for its coal mines and its fisheries as well as extensive forests and agricultural lands and is favoured with easy access by sea to the high-grade iron-ore supply of Newfoundland. On these resources are based the leading manufactures of primary iron and steel, fish processing, pulp and paper, shipbuilding and sawmills. In addition, an important petroleum refinery, railway rolling stock, coke and gas, miscellaneous iron and steel and aircraft plants add to the diversification of the Province, The forests of New Brunswick give a leading place to its pulp and

paper and sawmilling industries. Other important manufacturing and processing activities are based on fish and agricultural resources. There are also a number of metal working industries, such as heating and cooking apparatus, brass and copper products, etc.

Nova Scotia and New Brunswick, despite the lack of large rivers, have valuable sources of hydraulic power, a considerable portion of which has been developed. Tentative estimates give Newfoundland a potential of almost 1,000,000 h.p. at ordinary minimum flow, while in Labrador, the Hamilton River is outstanding as a potential source of power. Turbine installation at the end of 1957 totalled 337,970 h.p. in Newfoundland, 1,882 in Prince Edward Island, 181,958 in Nova Scotia and 209,130 in New Brunswick. Compared with Quebec, Ontario and British Columbia, the installed power in the Atlantic Provinces, is very small, amounting to 730,940 h.p. This compares with a total of 1,221,745 in the Prairie Provinces and 19,916,008 in the whole of Canada.

Manufacturing establishments reporting in 1957 numbered 3,446 for the Atlantic Provinces as a whole. These plants furnished employment to 64,651 persons who received \$187,182,459 in salaries and wages. They also shipped goods with a selling value at the factory of \$881,761,194 and spent \$485,338,979 for materials, while the value added by manufacture totalled \$362,353,683.

Considering the Atlantic Provinces as an economic unit, pulp and paper was the leading industry in 1957 with factory shipments valued at \$179,676,000. Fish processing and packing with factory shipments valued at \$81,181,000 was in second place. Other leading industries, in order of importance and with shipments exceeding \$30,000,000, were: petroleum products, primary iron and steel, sawmills, sugar refining and railway rolling stock. These seven industries accounted for 58 p.c. of the total value of factory shipments of the Atlantic Region. Other leading industries with shipments of \$10 to \$30 million and in order of importance, were: butter and cheese, shipbuilding and repairs, bread and other bakery products, slaughtering and meat packing, miscellaneous food preparations, sash, door and planing mills, printing and publishing, coke and gas products, breweries, prepared stock and poultry feeds, carbonated beverages and miscellaneous iron and steel products.

For the Atlantic Provinces as a whole there was a drop of 1.1 p.c. in the number of persons employed and an increase of 4.6 p.c. in the value of factory shipments in 1957 as compared with the previous year. Not all industries, however, shared in the increased shipments. Most of the seven leading industries reported increased shipments in 1957, ranging from 37.6 p.c. for petroleum products to 3.5 p.c. for railway rolling stock. Pulp and paper was down 6.2 p.c. while fish processing and

packing remained practically unchanged. For the leading industries with shipments of \$10 to \$30 million the trend was mixed. Increases were reported by seven industries, ranging from 23.8 p.c. for coke and gas products to 2.7 p.c. for printing and publishing. The remaining five industries in the \$10 to \$30 million class reported decreased shipments. The greatest decline of 11.0 p.c. was reported by sash, door and planing mills and the lowest decline of 0.2 p.c. by the miscellaneous iron and steel products industry. A notable feature of the 1957 manufacturing operations in the Atlantic Provinces was the continuing expansion in the petroleum products industry in Nova Scotia, with shipments increasing 38 p.c. over the previous year.

In the Atlantic region the program of industrial development has been more selective than in some of the other provinces. Fish processing, new sawmills, increased pulp-making capacity and the manufacture of non-metallic building materials like cement and gypsum products have accounted for well over half of the industrial growth. There are however, a few outstanding exceptions. Two sizeable defence plants have been established in Nova Scotia, one to repair and overhaul naval aircraft and the other to build and repair radar and related electronic equipment. Considerable development has taken place in Newfoundland, Besides plants for the manufacture of cement and gypsum wallboard and plaster, factories for producing boots and shoes, birch veneer, leather goods, industrial machinery and a leather tannery were established, thus broadening the industrial base of the province. With these exceptions, most of the developments in the Atlantic Provinces have been either small and scattered or confined to the modernization and expansion of manufacturing facilities that were already established at the close of World War II.

Principal Statistics of the Atlantic Provinces, 1957

Province	Estab- lish- ments	Employees	Salaries and wages	Cost at plant of materials used	Value added by manufacture	Selling value of factory shipments	
	num	ber	thousands of dollars				
Newfoundland	916	10, 473	32,784	53,995	56,544	117,714	
Prince Edward Island	193	1,663	3, 279	18, 315	6, 580	24,953	
Nova Scotia.	1,356	31,530	90,635	238, 287	175,683	427, 299	
New Brunswick	981	20,985	60,485	174, 742	123, 547	311,795	
Total	3,446	64: 651	187, 183	485, 339	362, 354	881, 761	

In spite of the rapid development in the Atlantic Provinces since 1949 manufacturing production did not quite keep pace with the development in the more industrialized provinces of Ontario, Quebec and British Columbia. This is indicated by a slight drop in the Atlantic Provinces' share of the Canadian total from 4.52 in 1949 to 3.97 in 1957. In number of persons employed there was an increase of 1.3 per cent for the Atlantic Provinces as compared with an increase of 15.8 per cent for Canada as a whole. For salaries and wages paid the increase was 57.2 per cent as compared with 85.8 per cent for Canada, and in selling value of factory shipments the increase was 53.3 per cent for the Atlantic Provinces and 77.6 per cent for Canada as a whole. The increased employment since 1949 reported by Newfoundland and Nova Scotia was offset by

declines in Prince Edward Island and New Brunswick, resulting in a net increase of only 1.3 p.c. for the Atlantic Provinces as compared with an increase of 15.8 p.c. for Canada.

As mentioned previously, the drop in manufacturing employment in 1957 in the Atlantic Provinces was 1.1 p.c., accompanied by an increase in the selling value of factory shipments of 4.6 p.c. This compares with an increase of 0.4 p.c. in employment and 2.5 p.c. in factory shipments for Canada as a whole. Nova Scotia manufacturers operated at a higher level in 1957 with an increase of 1.9 p.c. in employment and 11.2 p.c. in selling value of factory shipments. Both Newfoundland and New Brunswick reported decreases in employment and shipments, while Prince Edward Island, although reporting lower employment, nevertheless reported slightly higher shipments.

Variation in Employment and Factory Shipments, 1957 Compared with 1949

¹ Reported on a production basis.

SECTION 3. THE MANUFACTURES OF OUEBEC

Quebec with about 30 per cent of Canada's total selling value of factory shipments ranks as the second largest industrial province in Canada. The manufacturing industries of Quebec in 1957 shipped goods with a record selling value at the factory of \$6,679,595,056 and represents an increase of 0.9 p.c. over the previous year. Accompanying the increase in shipments was an increase of 0.7 p.c. in the number of persons employed which totalled 449,383. Although the value of factory shipments in 1957 was 24.0 p.c. higher than in 1953 the number of persons employed increased only by 1.8 p.c. This result conforms to the trend in recent years for employment to increase at a lower rate than volume of production. With the increase in automation and technological improvements this trend will in all probability continue at a more accelerated pace, Indicative of this trend is the increase since 1949 for Canada as a whole of 42.5 p.c. in the volume of production as compared with an increase of only 16.0 p.c. in the number of persons employed. Since indexes of volume of production are not available by provinces no comparison can be made for Quebec. There is no doubt, however, that the volume of production in Quebec in 1956 was the highest on record. In view of the drop of 1.8 p.c. in the volume of production in 1957 for Canada as a whole in spite of an increase of 0.4 p.c. in the number of employees, it is most likely that the volume of production in Quebec in 1957 was also slightly lower than in the previous year.

The recovery from the minor recession of 1954, which began in 1955, continued at an accelerated pace in 1956. This expansion in manufacturing production continued until the fall of 1957 when another downturn began. In spite of this slowing down in production the manufacturing industries of Quebec managed to record a small increase of 0.9 p.c. in employment and 0.7 p.c. in the selling value of factory shipments in 1957 as compared with the record highs reported the previous year. The non-durable goods industries which contribute 65 p.c. of the total manufacturing production of the province reported an increase in 1957 of 4.1 p.c. in the selling value of factory shipments and 0.6 p.c. in the number of persons employed. The durable goods industries on the other hand reported a drop of 4.6 p.c. in shipments with an increase of 1.0 p.c. in number of employees.

On the basis of employment provided, the non-durable or consumer goods industries in 1957 contributed 278,775 or 62 p.c. of the total manufacturing employment in Quebec, while the durable goods industries contributed the balance of 170,608 or 38 p.c. of the total. The clothing industries constituted the leading group in the non-durable goods sector with 56,838 employees. They were followed by foods and beverages with 48,593, textiles 38,556, paper products 36,724, chemicals and allied products 21,835, printing, publishing and allied industries 20,638, leather products 16,253, miscellaneous industries 10,996, knitting mills 10,367, tobacco and tobacco products 8,018, rubber goods 6,430, and products of petroleum and coal 3.527. In the durable goods sector the industries producing iron and steel products with 45,997 employees ranked as the major group. This was followed by transportation equipment with 37,906, wood products 32,941, electrical apparatus and supplies 24,106, non-ferrous metal products 17,673 and non-metallic mineral products 11.985.

In the non-durable sector the trend in physical output as represented by the variation in the number of employees was mixed in 1957. As compared with the previous year six of the groups reported increases and the other six reported declines. The printing and publishing group with an increase of 5.6 p.c. in the number of employees reported the greatest increase in production. This was followed by tobacco and tobacco products with an increase of 5.4 p.c., miscellaneous industries 4.5 p.c., foods and beverages 3.0 p.c., chemicals and allied products 3.0 p.c. and clothing 0.6 p.c. The greatest decline of 6.5 p.c. was reported by the rubber products group, followed by products of petroleum and coal with 3.7 p.c., textiles 3.0 p.c., leather products 2.5 p.c., paper and paper products 1.3 p.c. and knitting mills 1.2 p.c. The trend of employment in the durable goods sector was also mixed. The greatest increase was reported by the transportation equipment group, viz. 11.7 p.c. This was followed by iron and steel products with 3.1 p.c., and nonmetallic mineral products 1.7 p.c. Three groups in this sector reported declines. The non-ferrous metal products group with a drop of 9.9 p.c. in employment reported the greatest loss Wood products reported a drop of 5.0 p.c. and electrical apparatus and supplies 0.8 p.c.

² Includes: Breweries; Brass and copper products; Brooms, brushes and mops; Cement, hydraulic; Railway rolling stock; Shipbuilding and Sugar refining.

The change in the pattern of manufacturing employment in Quebec between 1953 and 1957 is illustrated in the table below. As a result of an increase of 2.4 p.c. in employment, the non-durable goods industries bettered their position with an increase to 62 p.c. of the total employment in 1957 from 61.6 p.c. in 1953. The durable goods industries also reported an increase in employment of 0.7 p.c., but their share of the total dropped to 38 p.c. from 38.4 p.c. For the non-durable

goods industries increases in employment ranged from 15.9 p.c. for printing, publishing and allied industries to 0.9 p.c. for knitting mills. Four groups reported declines which ranged from 10.1 p.c. for products of petroleum and coal to 4.7 p.c. for clothing. In the durable goods sector the variations ranged from an increase of 19.1 p.c. for non-metallic mineral products to a decline of 13.3 p.c. for transportation equipment.

Pattern of Manufacturing Employment in Quebec, 1957 and 1953

	Employees		Percentage of the total

Quebec has developed its \$6.7 billion manufacturing output with such leading industries as pulp and paper, non-ferrous metal smelting and refining, petroleum products, slaughtering and meat packing, cotton yarn and cloth, men's and women's clothing, tobacco, cigars and cigarettes, synthetic textiles and silk, railway rolling stock, leather footwear and miscellaneous electrical apperatus. In common with the rest of Canada, Quebec experienced a great industrial expansion following the second World War. Nor was this expansion confined to the existing industrial areas, but spread to many towns and villages in the accessible areas of the province.

Quebec's leading industry is pulp and paper with an output of approximately \$596 million in 1957. Quebec is a principal world centre for the production of newsprint with 56 major pulp and paper plants concentrated in the Trois Rivieres and Shawinigan Falls districts as well as along the Saguenay, Ottawa, and St. Lawrence rivers. The production of non-ferrous metals has expanded considerably during the past decade. The output of aluminum in Canada has made impressive strides during the past years and reached a record total of 620,000 tons in 1956. In 1957, however, the output dropped to 557,000 tons. Quebec, with its new furniture factories, its new titanium smelter and its expanded aluminum-making facilities, is challenging Ontario's long established lead in a number of the wood and non-ferrous metal products industries.

There are several important factors which contributed to the great industrial development of the Province. To begin with, the geographic situation of the Province is extremely favourable, with an excellent large harbour 800 miles inland where seagoing vessels of heavy tonnage can dock. There is also an extensive highway system linking the small rural areas to the big industrial centres. Other significant factors include abundant forest resources, water power, minerals, agricultural lands and, of even more importance, an industrious and stable population.

Quebec is the richest of Canada's provinces in water power resources and has sufficient reserves of undeveloped power to meet its foreseeable needs for some years to come. Its present installation approaching 9,000,000 h.p. is about 45 p.c. of the Canadian total. The province continued to extend its hydro-electric power facilities during 1957 with a net capacity increase of 473,900 h.p. The Quebec Hydro-Electric Commission completed the installation of the fourth and fifth 150,000 h.p. units in its Bersimis I development on the Bersimis River where the ultimate capacity of the underground powerhouse will be 1,200,000 h.p. At Beauharnois on the St. Lawrence River construction of the third and final section of the Commission's powerhouse moved ahead, and the completion of the entire plant, with a total installed capacity of 2,235,000 h.p. is expected in 1960. The Shipshaw plant of the Aluminum Company of Canada on the Saguenay River is rated at 1,200,000 h.p., while the seven hydro-electric plants of the Shawinigan Water and Power Company on the St. Maurice River have a total capacity of 1,695,000 h.p. Quebec thus excels in both the size of its hydro-electric installations as well as in the magnitude of horse-power developed.

Two of the most important industrial developments in Quebec today are the Ungava iron ore project and the new titanium industry. With the exploitation of the Ungava iron deposits on which it is believed, the future of the great steel industries of this Continent rests, Quebec's industrial base is being expanded to the point where the future industrial development of this Province is well assured.

Quebec's industries are not as diversified as those of Ontario, although a number have an output approximately half or more of the total Canadian production. The manufacture of pulp and paper occupies the premier position. Fifty years ago this industry had hardly come into existence in the Province and in the mid-1920's the annual gross value of production had not yet reached \$100,000,000. By the end of 1957 it accounted for about 9 p.c. of the gross value of Quebec's manufactures and for about 42 p.c. of the Canadian total for this industry.

Other large industries in which Quebec predominates, with their percentage of the Canadian total, are: tobacco, cigars and cigarettes 91.2, woman's factory clothing 70.1, cotton yarn and cloth 68.7; men's factory clothing 54.2; synthetic textiles 50.5; miscellaneous electrical apparatus and supplies 48.3; railway rolling stock 43.5; shipbuilding and repairs 42.8; pulp and paper 42.2; aircraft and parts 38.1; acids, alkalies and salts 37.2; petroleum products 36.4; brass and copper products 36.4; non-ferrous metal smelting and refining 35.8; miscellaneous chemical products 35.8; and furniture 34.0. Two medium-sized industries with Canada shipments of over \$100,000,000 also predominate in Quebec. These were leather footwear with 56.3 and medicinal and pharmaceutical preparations 44.9

Quebec also predominates in a large number of the smaller industries. The candle industry with 94.9 p.c. of the Canadian total was the leading industry in this category. Other industries with their percentages of the total are; men's clothing contractors 93.5; oiled and waterproofed clothing 90.8; women's clothing contractors 85.9; cotton thread 80.5; children's clothing 77.5; embroidery, pleating and hemstitching 74.7; narrow fabrics 74.1; dyeing and finishing of textiles 73.0; lasts. trees and shoe findings 70.1; oilcloth, linoleum and other coated fabrics 69.5; process cheese 69.4; fur dressing and dyeing 68.6; miscellaneous clothing 67.3; boot and shoe findings, leather 67.2; artificial flowers and feathers 62.0; fur goods 59.4; miscellaneous textiles 57.7; corsets 57.1; asbestos products 53.9, buttons, buckles and fasteners 51.0; and woollen cloth 40.3.

Manufacturing establishments reporting in 1957 numbered 12,250. These plants furnished employment to 449,383 persons who received \$1,477,828,336 in salaries and wages. They shipped goods with a selling value at the factory of \$6,679,595,056 and spent \$3,570,908,799 for materials. The value added by manufacture totalled \$2,947,897,608.

The value added is obtained by subtracting the cost of materials, including fuel and electricity, from the gross value of products. The difference represents the value added to the materials by labour. It is this difference which the employer of labour uses to pay for the labour itself, the overhead expenses, interest and profits.

To calculate the value of production, it is necessary to adjust the value of shipments for the difference in the opening and closing inventories of finished goods. As the census of industry schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added is obtained by subtracting from the shipments the cost of materials, including fuel and electricity. The value thus obtained is somewhat different to the actual value. Beginning with 1954 it is again possible to obtain value of production figures, by adding to the value of shipments the changes in the inventory of finished products. The figures for value added in 1954 and subsequent years are, therefore, comparable with 1951 and prior years.

TABLE 9. Principal Statistics of the Forty Leading Industries of Quebec, 1957

Reported on a production basis.
 Sugar refining is also a leading industry. Statistics, however, are confidential.

SECTION 4. THE MANUFACTURES OF ONTARIO

In spite of the minor downturn in production which began in the fall of the year, the manufacturing industries of Ontario in 1957 reported \$11,078,592,683 as the selling value of factory shipments, an increase of 4.0 p.c. over the previous year. This is the first time that shipments passed the eleven billion mark and accordingly are the highest on record. Accompanying the increase in shipments was an increase of 0.5 p.c. in the number of employees which totalled 644,245 in 1957, also a record. Although the selling value of factory shipments in 1957 exceeded the 1953 figure by 25 p.c., the number of persons employed was only 9,691 or 1.5 p.c. higher. This result conforms to the trend in recent years for employment to increase at a lower rate than the volume of production. With the increase in automation and technological improvements this trend will in all probability continue at a more accelerated pace. Indicative of this trend is the increase since 1949 for Canada as a whole of 42.5 p.c. in the volume of production as compared with an increase of only 16.0 p.c. in the number of persons employed, Since indexes of volume of production are not available by provinces no comparison can be made for Ontario. There is no doubt, however, that the volume of production in Ontario in 1956 was the highest on record. In view of the drop of 1.8 p.c. in the volume of production in 1957 for Canada as a whole in spite of an increase of 0.4 p.c. in the number of employees, it is most likely that the volume of production in Ontario in 1957 was also slightly lower than that of the previous year.

Ontario, which is now recognized as one of the world's major industrial areas, accounts for approximately half of Canada's manufacturing production. Here, the proximity of raw materials, cheap hydro-electric power, and a strategic location in relation to export markets, not only on this continent but overseas, have been the decisive factors in the development of Ontario to its present industrial position. Most of the manufactures of the province and most of its population are located in Southern Ontario. This area has the inestimable advantage of bordering on the St. Lawrence-Great Lakes waterway system which gives access westward to the heart of the continent and eastward to the shipping routes of the world, and which is also the source of most of Ontario's hydro-electricity. Many new industrial areas are being created as new industries and branch plants of established industries are increasingly being located in the smaller towns.

As Ontario is a major producer of durable goods, such as transportation equipment, primary iron and steel, telecommunication equipment and heavy electrical machinery, it therefore experiences wider fluctuations in manufacturing production than provinces producing non-durable or consumer goods. As a result, the small downturn of 1954 was more keenly felt by Ontario manufacturers. Factory shipments in that year were 3.9 p.c. lower as compared with a drop of 1.3 p.c. for Canada as a whole, while in employment the drop in Ontario was 5.6 p.c. while for Canada it was 4.5 p.c. Conversely, with the improvement during the past three years Ontario in 1957 reported an increase of 29.8 p.c. in factory shipments and 7.6 p.c. in employment as compared with 1954. This compares with increases of 26.4 p.c. and 7.2 p.c. for Canada as a whole.

On the basis of employment provided, the durable goods industries in 1957 contributed 343,363 or 53.3 p.c. of the total manufacturing employment in Ontario, while the non-durable or consumer goods industries contributed the balance of 300,882 or 46.7 p.c. of the total. Iron and steel is the leading group in the durable goods sector with 123,601 employees in 1957. It was followed by the transportation equipment group with 82,127, electrical apparatus and supplies 54,622, wood products 35,165, non-ferrous metal products 27,760, and non-metallic mineral products 20,088. In the non-durable goods sector the industries producing foods and beverages with 79,617 employees comprised the major group. This was followed by printing, publishing and allied industries with 37,276, paper products 36,423, textiles 27,145, chemicals and allied products 26,836, clothing 24,711, miscellaneous industries 21,060, rubber goods 15,679, leather and leather products 13,074, knitting mills 9,792, products of petroleum and coal 7,936, and tobacco and tobacco products 1,873.

As mentioned previously manufacturing employment in Ontario increased by 0.5 p.c. in 1957 as compared with the previous year. Producers of non-durable goods reported an increase of 3.0 p.c., while the producers of durable goods in which Ontario leads reported a drop of 1.6 p.c. This is a reflection of the downturn in production which began in the fall of the year. Most of the groups in the durable goods sector reported declines in employment with the wood products group reporting the greatest loss of 5.2 p.c. Non-ferrous metals and iron and steel products on the other hand reported slightly higher employment. In the non-durable goods sector the trend of employment was also mixed. Most of the groups reported increases, ranging from 8.9 p.c. for foods and beverages to 1.0 p.c. for leather and leather products. Five of the groups of this sector reported losses in employment. Tobacco and tobacco products suffered the greatest decline of 5.8 p.c. and the products of petroleum and coal group the smallest decline of 0.8 p.c.

Despite the great industrial progress made by other provinces, Ontario continues to maintain its predominance and in 1957 produced about 50 per cent of the nation's manufactured goods. A vast increase of steel ingot capacity is being made possible by developments of Steep Rock Iron Mines. At Sarnia, huge investments have gone into the construction of new plant for a whole group of new products based on Alberta oil flowing through the Edmonton-Superior pipe line. Other significant developments are taking place in synthetic rubber, synthetic textiles, and industrial and consumer chemicals. Ontario has continued to gain in such traditional lines as motor vehicles, industrial and farm machinery, and the manufacture of household equipment. The same may be said of other "hard" goods like business and office machinery and electrical apparatus and supplies. Numerous plants making aircraft components and building materials have favoured the Toronto area, while chemical and synthetic textile plants have been rising in the vicinity of Sarnia and along the lower reaches of the St. Lawrence River between Cornwall and Kingston.

Ontario has the greatest diversification of manufacturing production of any province. Certain industries, such as the manufacture of motor vehicles, motor vehicle parts, heavy electrical machinery, agricultural implements, machine tools, starch and glucose, and the processing of raw tobacco are carried on practically in this province alone. Of the forty leading industries in Canada in 1957, a substantial number of them were dominated by Ontario's share of the total production. These industries, with the percentage which the production of each bears to that of the 1957 Canada totals are as follows: motor vehicles 98.8, motor vehicle parts 94.5, heavy electrical machinery 90.7, rubber goods 81.5, primary iron and steel 77.4, telecommunications equipment 77.0, iron castings 69.9, fruit and vegetable preparations 67.6, sheet metal products 59.1, industrial machinery 58.9, miscellaneous chemical products 58.2, printing and bookbinding 57.8, brass and copper products 57.5, acids, alkalies and salts 55.3, aircraft and parts 54.8, boxes and bags, paper 50.4, furniture 49.0, printing and publish ing 48.2, non-ferrous metal smelting and refining 47.7, synthetic textiles 47.3, miscellaneous electrical apparatus and supplies 47.0, and stock and poultry feeds 45.6.

There are also a number of medium-sized industries with a total Canadian production of over \$100,000,000 in which Ontario dominated. Agricultural implements with 90.0 p.c., soaps and washing compounds 88.4, refrigerators, vacuum cleaners, etc. 80.7, household and office machinery 79.7, hardware, tools and cutlery 74.0, heating and cooking apparatus 68.3, and confectionery 57.7 were in this category.

In addition, Ontario dominated many of the smaller industries in 1957 as indicated by the following percentages of the Canadian total. In this category were: machine tools 100.0, tobacco processing and packing 94.7, miscellaneous non-ferrous metal products 93.2, bicycles 90.0, prepared breakfast foods 90.6, agricultural implements 90.0, wine 86.9, automobile accessories, fabric 85.5, typewriter supplies 85.5, leather tanneries 85.0, artificial abrasives 82.5, sporting goods 76.3, cordage, rope and twine 76.0, toys and games 74.3, white metal

alloys 73.0, carpets, mats and rugs 72.4, jewellery and silverware 72.4, feed mills 71.6, batteries 70.7, wool yarn 69.7, aluminum products 65.0, boilers, tanks and plate work 59.1, animal oils and fats 57.7, knitted goods, other than hosiery 46.1, hosiery 43.2, etc.

Establishments reporting in 1957 numbered 13,580. They furnished employment to 644,245 persons who were paid \$2,430,676,464 in salaries and wages, and spent \$5,827,317,500 for materials used. The value added by manufacture which is the calculated value of production less the cost of materials used, including the cost of fuel and electricity, amounted to \$5,047,710,789, while the selling value of factory shipments totalled \$11,078,592,683.

The value added is obtained by subtracting the cost of materials, including fuel and electricity, from the gross value of products. The difference represents the value added to the

materials by labour. It is this difference which the employer of labour uses to pay for the labour itself, the overhead expenses, interest and profits.

To calculate the value of production, it is necessary to adjust the value of shipments for the difference in the opening and closing inventories of finished goods and goods in process. As the census of industry schedules for 1952 and 1953 did not contain data on opening and closing inventories, no calculation can be made directly for value of production. For these two years, therefore, the value added is obtained by subtracting from the shipments the cost of materials, including fuel and electricity. The value thus obtained is somewhat different to the actual value. Beginning with 1954 it is again possible to obtain value of production figures, by adding to the value of shipments the changes in the inventory of finished products and goods in process. The figures for value added since 1954 are, therefore, comparable with 1951 and prior years.

TABLE 10. Principal Statistics of the Forty Leading Industries, of Ontario 1957

¹ Reported on a production basis.

SECTION 5. THE MANUFACTURES OF THE PRAIRIE PROVINCES

The leading industries of the Prairie Provinces are those based on agricultural resources - grain-growing, cattle-raising and dairying areas. Next in importance, generally, are industries providing for the more necessary needs of the resident population, such as the baking of bread, printing and publishing. etc. The extensive railway services require large shops for the maintenance of rolling-stock, especially in the Winnipeg area. The widespread use of motor vehicles and power machinery on farms has given rise to petroleum refineries in each province. This industry has made tremendous strides in the Prairie Provinces since 1949. At that time it ranked third in importance. being outranked by slaughtering and meat packing which was then in first place and by flour mills which ranked second. In 1956 it assumed the premier position in the Prairie Provinces in selling value of factory shipments. Of greater significance is the fact that it has increased its proportion of the total manufacturing production of the Prairie Provinces from 8.5 p.c. in 1949 to 19.6 p.c. in 1957. Manitoba, as the early commercial centre of the prairies, has had a greater industrial development than either of the other provinces. Its natural resources of accessible water power, forests and, more recently, minerals, have given rise to quite a diversification of industrial production. In Saskatchewan, while the main economic role continues to be played by agriculture, both oil and mineral wealth are being developed.

Considering the Prairie Provinces as an economic unit, slaughtering and meat packing with shipments valued at \$297,702,000 in 1957 again assumed the premier position. displacing petroleum products which came a close second with shipments valued at \$292,043,000. Butter and cheese ranked third with \$100,977,000 followed by flour mills with \$85,975,000 and railway rolling stock \$49,745,000. These five industries accounted for about 55 p.c. of the total value of factory shipments of the Prairie Provinces. Other leading industries, in order of value of factory shipments and with shipments of \$15,000,000 or more were: bread and other bakery products, printing and publishing, breweries, men's factory clothing, sash, door and planing mills, furniture, miscellaneous food preparations, bridge and structural steel, concrete products, sheet metal products, pulp and paper, sawmilis, printing and bookbinding aircraft and parts sugar refining hydraulic cement. prepared stock and poultry feeds, carbonated beverages, and boxes and bags, paper. Non-ferrous metal smelting and refining is also a major industry in the Prairie Provinces. Information concerning it cannot, however, be published without disclosing the operations of individual companies.

In water-power resources, the Prairie Provinces are not so well endowed as the more highly industrialized provinces of Quebec, Ontario and British Columbia. At the end of 1957 power installation in the three provinces totalled only 1,221,745 h.p. or about 6 p.c. of the Canadian total. Manitoba had 803,900 h.p., Saskatchewan 109,835 h.p. and Alberta 308,010 h.p. With the present developments of natural gas and oil, the Prairie Provinces, will in large measure be able to overcome a lack of water-power resources which is so vital to industrial development.

In the Prairie Provinces, the nature of developments vary from one province to another. Alberta has moved to the forefront, especially since 1950. There the emphasis has been more on the manufacture of machinery and equipment for the burgeoning oil and gas industries. Chemicals, and especially petrochemicals, have made striking gains; second in terms of new growth, they now embrace various rayon intermediates and polythene plastics, as well as fertilizers and the manufacture

of other new inorganic products like caustic soda and chlorine. Sizeable gains have been made by the expansion of food-processing plants and the construction of still more factories for making building materials, transportation equipment, paper products and textiles. Based on the increase in employment between 1949 and 1957, the iron and steel products group with an increase of 2,423 employees reported the greatest expansion in production. This was followed by foods and beverages with an increase of 2,061 employees, chemicals and allied products 1,341, transportation equipment 1,314, products of petroleum and coal 1,309, paper products 1,029, non-metallic mineral products 879, printing, publishing and allied industries 771, and non-ferrous metal products 711. Minor increases were reported by the remaining groups, with wood products remaining practically unchanged.

Developments in Saskatchewan, by contrast, have continued along more or less traditional lines since 1949. The largest gain of 722 employees has been recorded by the products of petroleum and coal group which includes oil refineries. The second highest gain of 188 employees was reported by the non-metallic mineral products group which consists of a number of industries manufacturing building materials. Considerable expansion was also reported by the printing, publishing and allied industries. Wood products with a drop of 211 employees was the only major group to report a decline in production; this no doubt being due to the decline in the exports of lumber and its products during the past few years.

Although Manitoba experienced considerable development in manufacturing production since 1949, it did not, percentagewise, keep pace with the other two Prairie Provinces. The change was not so much in the magnitude but rather in the nature of manufacturing production. The emphasis has shifted from the production of food and clothing to the production of products of mineral origin, such as iron and steel, non-metallic mineral products and products of petroleum and coal. There was also a wider diversification of products as is evidenced by the increase of 291 employees in the miscellaneous group. For manufacturing as a whole the increase in the number employed totalled 1,928. The largest increase of 630 was reported by the iron and steel group. The products of petroleum and coal group with 552 reported the second largest increase, followed by electrical apparatus and supplies with 515, non-metallic mineral products 499 transportation equipment 344, miscellaneous industries 291 and paper products 214. Only three groups reported major declines in employment: foods and beverages 696, clothing, including knitting mills, 300 and textiles 243. The foods and beverages group which in 1949 accounted for 25 p.c. of the employment in manufacturing, accounted for only 23 p.c. of the total in 1957. The foods and beverages group with 9.930 employees was still in first place in 1957 as an employer of labour. This was followed by transportation equipment with 7,006, clothing, including knitting mills, 6,083, iron and steel products 5,404, printing, publishing and allied industries 3,909 and wood products 3,186. These six groups accounted for 81 p.c. of the manufacturing employment in

According to Table 1, manufacturing establishments in 1957 numbered 4,327 for the Prairie Provinces as a whole. These plants furnished employment to 94,985 persons who received \$318,153,043 in salaries and wages. They also shipped goods with a selling value at the factory of \$1,755,125,360 and spent \$1,030,039,991 for materials, while the value added by manufacture totalled \$694,798,654.

In spite of the rapid development in the Prairie Provinces since 1939, manufacturing production did not keep pace with the developments in the more industrialized provinces of Ontario, Quebec and British Columbia. This is indicated by the slight drop in the Prairie Provinces' share of the Canadian total from 8.13 p.c. in 1939 to 7.91 p.c. in 1953. In 1954 conditions were reversed. The Prairie Provinces reported an increase of 1.4 p.c. in the value of factory shipments as compared with a decline of 1.3 p.c. for Canada as a whole. As a result of this the Prairie Provinces' share of the Canadian total was again 8.13 p.c., the same as in 1939. In 1955 and 1956, however, the

situation deteriorated again with the percentage of the total dropping to 7.62. There was an improvement in 1957, the percentage increasing to 7.91, the same as it was in 1953.

According to the table below, Manitoba and Saskatchewan did not keep pace with manufacturing developments in Canada as a whole. Alberta on the other hand fared much better. Compared with 1949 employment increased by 47.9 p.c. and value of factory shipments by 110.9 p.c. This compares with increases for Canada as a whole of 16.0 p.c. and 77.8 p.c. respectively.

Variation in Employment and Factory Shipments, 1957 Compared with 1949

Province	Employees	Earnings	Selling value of factory shipments
		per cent	
Manitoba	+ 4.6	+ 62.9	+ 40.0
Saskatchewan	+10.8	+ 79.7	+ 41.9
Alberta	+47.9	+148.7	+110.9
Prairie Province s	+19.9	+ 94.1	+ 65.2
Canada	+16.0	+ 86.0	+ 77.8

SECTION 6. THE MANUFACTURES OF BRITISH COLUMBIA

British Columbia, with factory shipments valued at \$1,785,298,750, ranked third among the provinces in manufacturing production. In spite of the rapid industrialization of other provinces, British Columbia succeeded in increasing its share of the total Canadian output. This is reflected in the increase in the total from 7.1 p.c. in 1939 to 8.6 p.c. in 1956. With the minor decline in business activity and the drop in the export of lumber and its products, British Columbia in 1957 was affected more than was the case for Canada as a whole, with the result that its share of total shipments dropped to 8.05 p.c.

Forest resources, fisheries, minerals and electric power have given a broad base and wide diversification to its industrial development. While Ontario and Quebec have an outstanding predominance in each of the major industrial groups of the Standard Industrial Classification, in the production of

wood products, however, British Columbia with 39 p.c. of the Canadian total holds the dominant position, outranking both Ontario and Quebec which account respectively for 26 and 23 p.c. of the total.

Emphasizing the importance of the forests in the industrial life of the Province, the sawmilling industry ranked first with a gross value of factory shipments of \$335,039,000, and pulp and paper second with \$169,469,000. Third in importance was the petroleum products industry with factory shipments valued at \$136,366,000. This industry received a great impetus in the completion of the Trans-Mountain oil pipeline. In 1953, with shipments valued at \$40,562,462 it ranked seventh, and contributed about 3 p.c. to the total value of factory shipments of the Province. In 1954 it assumed third place with the proportion of the total increasing to 5.5 p.c., with a further increase to 7.6 p.c. in 1957. In fourth place was veneer and plywood with

² Cement, hydraulic and Non-ferrous metal smelting and refining are also leading industries. Statistics, however, are confidential since there are less than three firms reporting.

² Includes: Fertilizers, Non-ferrous metal smelting and refining, Railway rolling stock and Sugar refining.

\$76,750,000 while in sixth place was fish processing, based principally in the estuarial salmon fisheries. This industry was in third place in 1953. British Columbia accounted for approximately 42 p.c. of the output of the fish processing industry in 1957 and plays a large part in making Canada the largest fish exporting nation in the world. Other important industries are: sash, door and planing mills, slaughtering and meat packing, shipbuilding, miscellaneous food preparations, butter and cheese, bread and other bakery products, fruit and vegetable preparations, printing and publishing, bridge and structural steel work, fertilizers, etc. The non-ferrous metal smelting and refining industry also ranks among the leading industries. Information, however, cannot be published as there are less than three smelters located in the province.

A feature of recent progress has been that new developments are taking place in areas far removed from accepted industrial centres. Growing lines of communication and transportation are fanning out from and leading into formerly locked interior communities to tap a vast new potential and offer new sources of provincial economic unity and strength. Factories and plants in remote sections are drawing greater value in employment and dollars from natural resources. The growth of the province industrially may be indicated by the increase in employment which is two and one-half times the pre-war figure. In dollar terms, gross value of manufacturing is also up 650 p.c. since 1939. The consumption of 6.5 billion kwh. of electric power by manufacturers during 1955 marks a steady upward climb of 200 per cent in the past decade.

British Columbia ranks second among the provinces in available water-power resources, and its hydraulic development which at the end of 1957 totalled 3,122,460 h.p. out of a Canadian total of 19,916,008 h.p. is exceeded only by Quebec and Ontario. Present developments are located chiefly in the southern part of the Province where a number of important sites are still available for development. Hydro-electric construction was very active in 1957 with a total of 607,500 h.p. of new capacity. The Aluminum Company of Canada installed the fifth

and sixth units, each of 150,000 h.p., in its Kemano-Kitimat plant. A seventh unit of 150,000 h.p. will be installed in 1958, and the ultimate capacity is expected to be about, 2,000,000 h.p. This power will be used in the production of aluminum which is a new product for British Columbia. Present capacity of the smelter is 210,000 tons of aluminum per annum, a production which will further strengthen Canada's position as an important source of this vital metal.

Manufacturing establishments reporting in 1957 numbered 4,250. These plants furnished employment to 105,631 persons who received \$405,129,932 in salaries and wages. They also shipped goods with a selling value at the factory of \$1,785,298,750 and spent \$985,519,123 for materials, while the value added by manufacture totalled \$767,914,301.

The expanding trend of manufacturing production in British Columbia during the past few years was reversed in 1957. Both employment and value of shipments declined, the former dropping 2.7 p.c. and the latter by 4.0 p.c. This compares with an increase of 2.5 p.c. in value of factory shipments and 0.4 p.c. in employment for Canada as a whole. There was an expansion in manufacturing activity in British Columbia during 1954, at a time when the rest of Canada was experiencing a minor recession. For Canada as a whole there was a drop of 4.5 p.c. in the number of employees and 1.3 p.c. in value of shipments. British Columbia was the only province in 1954 to report increased employment, the increase being 2.2 p.c. Although British Columbia was not the only province to report increased shipments that year, the increase of 7.9 p.c. was, however, the highest of any province. In common with other provinces, manufacturing in British Columbia continued to expand during 1955 and 1956. It reported the second highest increase in employment and value of factory shipments, Alberta being first in both respects. Since 1953 employees in British Columbia were 12.6 p.c. higher as compared with an increase of only 2.4 p.c. for Canada, while the value of factory shipments were 30.6 p.c. higher for British Columbia and 24.7 p.c. for Canada as a whole.

Reported on a production basis.

² Non-ferrous metal smelting and refining is also a leading industry. Statistics, however, are confidential since there are less than three firms reporting.

SECTION 7. MANUFACTURING INDUSTRIES IN URBAN CENTRES

The prosperity of most of the cities and towns of Canada, especially in the east, is intimately connected with their manufacturing industries, which provide employment for a large proportion of their gainfully occupied population. In the west the cities are more largely distributing centres, though manufactures are rapidly increasing there also.

Table 15, indicating the extent to which the manufacturing industries of Canada are concentrated in urban centres, shows by provinces the proportion contributed by cities and towns having factory shipments of over \$1,000,000 each. In the more highly industrialized provinces of Ontario and Quebec such cities and towns in 1957 accounted for 79 p.c. and 95 p.c. respectively of the totals for those provinces, while for the Atlantic Provinces and British Columbia, where sawmilling, fish-packing, and dairying are leading industries, the propor-

tions are 68 p.c. and 50 p.c. respectively. In the Prairie Provinces manufacturing is confined to a few urban centres.

During the past few years there has been a noticeable trend for manufacturing plants to locate in rural areas adjacent to incorporated cities and towns. This trend is revealed by a study of the percentages in the table below during the past few years. In 1957 for Canada as a whole 80.6 p.c. of the shipments were made by cities and towns with factory shipments of \$1,000,000 and over, as compared with 86.9 p.c. in 1953. Toronto is a good case in point. In 1953 Toronto accounted for 72.0 p.c. of the total shipments of York County and the rural areas for 12.2 p.c., while in 1957 Toronto's share dropped to 59.6 p.c. with the rural areas increasing to 26.9 p.c. The same trend is apparent in other manufacturing centres. This accounts for the changes that have taken place during the past few years in some of the provinces and for Canada as a whole.

TABLE 15. Cities and Towns Each with Selling Value of Factory Shipments of Over \$1,000,000, Number of Establishments and Total Shipments in such Urban Centres as a Percentage of the Grand Total, by Provinces, 1957

Note: Statistics published in this table are in some cases higher than the figures published in Table 18, since in the table below are included towns with shipments of over \$1,000,000 for which statistics must be withheld. It is not possible to publish this information in Table 18 without disclosing the operations of individual establishments.

Province Number of uncentres with selling value of factory shipments over \$1,000,		Number of establishments reporting in urban centres with selling value of factory shipments of over \$1,000,000	Selling value of factory shipments of urban centres having \$1,000,000 or over	Selling value of factory shipments of each province	Selling value of factory shipments of urban centres as a percentage of shipments in each province

¹ Net value is derived from gross value by deducting cost of materials, fuel and electricity. For cost of fuel and electricity in 1957 see Table 18.
² Since 1952 the basis of collection was "Selling value of factory shipments" instead of "Gross value of products".

APPENDIX II

Alphabetical List of the Products Reported as having been Manufactured in Canada in 1957

The appended list of the products of Canadian manufacturing industries presents the value and in most cases the quantity of the individual products in a much more detailed form. Prior to 1927, in presenting statistics of manufacturing production, the whole production of an establishment was taken as a unit. This not only prevented the presentation of production figures for specific products in detail, but also involved numerous inaccuracies in the production statistics of classes of commodities, owing to the fact that commodities which may be the major line of production in one establishment may also be products of secondary importance in another establishment where the major line of production puts the establishment into a different class. The statistics which follow. however, have been compiled by taking from the individual returns of each of the 37,875 manufacturing establishments covered, the value and, when given, the quantity of each commodity specified as produced by the establishment. In this way, detailed production figures are obtained for specific commodities and, furthermore, the total production of each commodity is brought together, no matter how varied may be the operations in different establishments producing it. Nevertheless it should be pointed out to those making use of these figures that there is one element of incompleteness about them. In the returns of many manufacturers, products of minor importance are grouped under the name "all other products". As will be seen from the group at the end of the list, the value of products not specified, while they may appear unimportant to the individual manufacturer, are, in the aggregate, a large amount, especially in the industries of two of the larger groups. It is obvious that one manufacturer may consider a product of insufficient importance to report separately for his establishment, while that same product may be reported separately by other establishments. In other words, included in the value of other products not specified at the end of the list, there are doubtless values which, had the products been specified by the manufacturer, would have been included in values of commodities appearing on the list. However, the products not specified total only about 2.1 per cent in value of the whole manufacturing production, although in the iron and steel group this proportion is 4.8 per cent and in transportation equipment 7.3 per cent. With the exception of these groups, therefore, the incompleteness of the figures on this account is insignificant.

There is no duplication in the listing of products, nor do any of the items, include products listed in more detail under another name. It is possible, however, that essentially the same commodity produced in different establishments may have been called by different names; in such a case, which is probably a very rare one, the items would appear separately in the following list.

It should be noted that a shipments' concept instead of the value of production concept was adopted in 1952. Items still collected on a production basis are marked with an asterisk.

Alphabetical List of Commodities, 1957

Note: In 1952 and subsequent years the basis of collection, is "Value of Factory Shipments" instead of "Gross Value of Products". However, the commodities marked * are still on a production basis.

Infants' wear (see also "Knitted infants' wear")—Concluded:			\$
	doz.	59, 861	741, 886
Rompers Sleepers (see also "Children's sleepers") Sleeping bags	66	76, 807	865, 693
Sleeping bags	_	9, 203	603, 287 612, 639
Not specified Ingots (see "Aluminum", "Steel", "Brass", "Bronze") Ink eraser, liquid			,
Ink eraser, inquid	lb.	30, 174, 862	14, 809, 936
Ink, writing	-	-	357, 012
Ink, not specified	_	_	346, 760 5, 664, 905
Instruments, (indicating, recording, controlling, etc. n.e.s.):			
Aircraft engine and flight instruments		-	13, 601, 446 12, 879, 214
Flow and liquid level instruments and accessories	_		1, 617, 364
Optical instruments Pressure measuring, including gauges and accessories	-	-	173, 700
Temperature and hygrometric instruments and accessories	_		1, 928, 694 6, 653, 324
Other instruments and accessories, n.e.s.	-		9, 389, 216
Insulating materials, n.e.s. (see also "Wool, mineral" and "Vermiculate") Insulators, porcelain and insulator parts	_		2, 806, 845 6, 952, 677
Interoffice communication sets, excluding telephone apparatus provided	-	_	451, 478
Iron, pig: Quantity made	ton	3, 718, 350	
Quantity shipped	ton	734, 353	40, 953, 372
Iron and steel products, rolled, n.e.s.	-	_	1, 110, 039
Irons, electric	_	_	4, 860, 453
Ironers, electric	No.	2, 740	310, 067
Iron work ornamental and architectural	_	-	19, 890, 621
Ironing boards Irrigation equipment	_		575, 985 301, 710
Jacks, auto	-	-	1 1
Jacks, lift, screw and ratchet Jams	lb.	78, 746, 485	16, 298, 252
Javelle water	-	_	9, 913, 573
Jellies	lb.	7, 529, 626	1, 849, 530 23, 369, 561
Jewellery Jigs and fixtures		_	3, 227, 006
Jointers, woodworking		-	1
Jute, jute paddings and jute yarn	-	_	474, 142
Kegs, fish			1
Kegs, nail, etc	No.	768, 225 330, 065	566, 033 2, 176, 199
Kitchen equipment for hotels, cafeterias, etc.	_	-	6, 265, 501
Kitchenware, aluminum, including pressure cookers	-	-	6, 801, 989
Kitchenware and ovenware, glass (included with "Glass, pressed and blown") Kitchenware, other (see also "Woodenware, kitchen	_		6, 517, 732
Knitted fabrics:	11.	1 741 145	1 500 017
Cotton stockinette, including meatwrap Cotton, not specified	lb.	1, 741, 145 2, 208, 185	1, 598, 017 2, 842, 144
Nylon and nylon mixtures	66	2, 208, 185 3, 200, 899	10, 138, 273
Rayon and rayon mixtures Wool	**	3, 451, 116 734, 379	4, 396, 429 1, 710, 347
Other		442, 039	1, 006, 868
Knitted goods, miscellaneous:	_	_	2, 495, 481
Infants' jackets, booties, etc. Not specified	= 1		295, 294
Knitting, custom		_	701, 423
Knives, machine Knives, bread and paring	_		1, 866, 901
Labels, gummed paper	-	_	2, 236, 465
Labels, fabric Lace, all kinds	_	_	1, 210, 807 2, 813, 839
Laces, corset	-	-	30, 576
Laces, shoe, (silk, cotton, etc.)	_	_	1, 126, 418 1, 271
Laces, shoe, leather Lacquers	gal.	2, 735, 481	8, 215, 287
Lacrosse sticks Lactose (see "Sugar of milk")	-	_	1
Lactose (see "Sugar of milk") Ladders, step, extension, etc.	_	_	2, 147, 847
Laminates, plastic; decorative, industrial, etc.	-	_	10, 410, 880
Lamps, incandescent, except therapeutic (bulbs)	No.	6, 909, 317	17, 881, 178 5, 567, 803
Lamps, fluorescent (bulbs)	24	42, 796, 802	3, 360, 521
Lamps, mercury, etc. (bulbs)	-		700, 456
Lamps, electric: Floor	-	_	2, 767, 221
Table	-	_	4, 834, 351 1, 073, 742
Other Lamps, other	_	_	395, 662
Lamp shades and wire frames		_	2, 512, 687
Lanterns including railway marine, etc.	lb.	95, 230, 114	16, 552, 350
Lard Lasts, trees, and shoe findings, not specified	-	-	1, 959, 283
		_	1
Latex compounds			
Latex compounds Latex, foamed (included in "Rubber goods, sponge and soft") Lathes, metal-working	No.	93 288	588, 4 38 19, 789

 $^{^{\}mbox{\scriptsize 1}}$ Indicates that the commodity was reported by one or two concerns.

Items	Unit of measure	Quantity	Value of factory shipments
			\$
ath, gypsum		322, 401, 967	9, 744, 05
eaths, woodead, naphthenate	–	116, 384	1, 247, 61
ead, refined (metal)	lb.	53, 941, 643	8, 248, 97
ead, white, dry	-	. — — — — — — — — — — — — — — — — — — —	1
ead, white, ground in oilead, sheet		4, 811, 182	953, 50
ead products, n.e.s. ead for pencils		_	1, 976, 17 161, 33
eather:	1		
Bag, case and strap		179, 938 2, 098, 503	213, 07 876, 01
Garment		4, 704, 253	1, 273, 58
Glove	–	=	2, 828, 62
Lace		162, 349	263, 41
ole:		4 400 000	000 00
Bellies		1, 132, 936 7, 959, 481	379, 72 4, 811, 32
Shoulders		2, 454, 880	1, 118, 38 105, 44
Not specifiedpholstering (included in "Leather, not specified")	-		105, 49
pper leather:		10, 499, 502	7, 032, 18
Catle and horse hides		56, 614, 620	18, 475, 69
Chrome splits	*****	14, 326, 111 462, 826	2, 386, 26 130, 76 17, 64
Sheep skins Patent and enamelled shoe leather, (included in "Other upper leather, not specified	2115	74, 740	17, 6
Other, not specified	a.,)	6, 203, 507	2, 413, 64
eather splits, not specified	-	_	1, 188, 54 1, 711, 25
eather, not specifiedeather, artificial	sq. yd.	7, 520, 974	7, 874, 44
eather goods, not specifiedecithin		_	107, 03 201, 2
emon butter and cheese		4 050 000	1
enses, opticalenses, optical, contact	No.	4, 058, 007	3, 336, 31
enses for optical instruments		_	496, 98
ighter fluid		-	762, 23
ighters, cigarette, and partsighting equipment, n.e.s.		_	992, 06 2, 768, 83
ightning rods and supplies	–	-	1
igninignosulphonates		_	1
ime, quick (including value of containers)		Ξ	17, 528, 78 1, 416, 13
imestone (building and monument)	****		
inings, brake, asbestosinings, glove and shoe		Ξ	3, 845, 61 761, 76
inings, n.e.s. inoleum (see ''Floor covering'')		-	1, 424, 9
iquors, acid		-	1
ithargeockers and shelving, metal		_	5, 968, 9
ocomotives, diesel-electric, new* ocomotive and car parts n.e.s.	No.	530	94, 829, 5
ocomotive and car parts n.e.s.	cord	10, 856	20, 915, 33 70, 60
ooms, weaving		-	1
umber, matched	M ft. b.m.	154, 064	15, 271, 9
umber, planedumber sawn*		1, 344, 685 7, 102, 365	95, 655, 7 466, 305, 5
umber, sawn*umber, not specified*	-	-,,	1, 847, 4
ye lacaroni and spaghetti, canned	lb.	36, 649, 337	4, 563, 9
<pre>lacaroni, vermicelli, spaghetti, etc. dry</pre>	*****	90, 878, 222	12, 239, 6
Accounting machines (included in "Machinery, office")		10.041	0.075.0
Adding Bakers', mixing	"	18, 641 691	3, 075, 00 692, 0
Bakers', not elsewhere specified		_	547, 2
Boring (metal-working)	No.	16	484, 4
Canning and parts Cleaning and pressing (included in "Laundry, cleaning and pressing") Coal handling and coal pulverizing		-	1
		ena.	1, 494, 10
Concrete and cement making Construction		_	3, 581, 2 1, 948, 1
Conveying and elevating (except passenger and freight elevators) and parts		_	21, 909, 0
Dairy and milk products, plant machinery, excluding milking machines		_	1, 978, 3 10, 311, 1
Flour and grist mill, n.e.s. Food products machinery, n.e.s. including milking machines		_	220, 9: 2, 809, 7:
Grain grinding, rolling, etc.		_	218, 1
Grain loaders and elevators		***	3, 208, 3

¹ Indicates that the commodity was reported by one or two concerns.

Items	Unit of measure	Quantity	Value of factory shipments
fachinery — Concluded:			\$
Hoisting, except mine hoists	_		21, 102, 292
Kitchen and other nousehold	-	-	3, 874, 571
Laundry, cleaning and pressing Logging		_	1, 697, 673 1, 184, 273
Lumber and shingle drying		notes (867, 422
Metal-working, n.e.s. Milking (included in "Food products machinery n.e.s.")		-	294, 477
Milking (included in 'Food products machinery n.e.s.')			10 401 500
Mining and metallurgical, n.e.s. and parts Office, n.e.s. (see also "Machinery, adding")		_	13, 421, 523 28, 600, 467
Oil refining	_	_	3, 777, 056
Plastics	-	-	23, 309
Printing	-		1, 400, 667
Pulp and paper			32, 948, 651 3, 383, 350
Rock drilling, earth boring and related machinery, n.e.s.	_	-	5, 770, 352
Rolling mill	-	-	3, 812, 910
Rubber mill	-	_	1, 688, 919
Saw and planing mill	_	_	3, 220, 798
Ships' and fittings	_	_	4, 138, 812
Stone working	-	an an	72, 307
Textile, n.e.s.	_	-	422, 354
Transmission		_	3, 273, 778
Washing machines:			
Electric	No.	271, 013	30, 402, 952
Other power	- "	5, 734	608, 531
Parts and accessories		_	15, 080 3, 832, 828
Wood-working, n.e.s.	_		1, 333, 026
Wrapping and packaging	-	_	933, 830
Other, not specified		-	22, 854, 915
Machinery parts, not specifiedagnesium products			2, 225, 702
ilt, made for sale	400	_	1
ult, caramel	-		1
4t flour		-	86, 291
alt extract and syrup	_	_	1
alt coomings and sproutsanganese naphthenate			1
antles, lamp and stove	_	444	1
anure spreaders and loaders	No.	3, 773	1, 394, 328
aple products	_		1 212 663
apsarble monuments			1, 313, 663 500, 015
arble for building purposes	_	_	1, 099, 963
argarine and margarine substitute	lb.	129, 893, 101	31, 167, 673
rine and fishermen's supplies	1b.	21, 502, 022	201, 249 3, 996, 738
armaladesassage units (vibrators)	-	22,002,022	1
atch splints and match blocks	-		1, 985, 787
atchers, wood-working	No. of books	592, 311, 068	1 007 20
atches (in books)atches, other	No. of books	392, 311, 000	1,907,308
ats and matting, rubber	_	_	3, 699, 039
attresses, air and sponge	-		1
attresses, spring filled and other	No.	1, 346, 134	23, 518, 523
eal, cereal grasseal, cocoanut oilcake	ton	52, 812	3, 184, 268
eal, corneal, corn	ton	6, 822	633, 760
eal, fish		60, 355	7, 742, 00
eal, linseed oilcake	66	60, 735	4, 075, 56
eal, meat, hoof, lung, liver, etc.		36, 716	3, 021, 00
eal, rapeseed oilcakeeal, rice		_	1
eal rye	ton	1, 033	63, 800
eal, sunflower oilcake		200 500	20 471 200

APPENDIX III

PUBLICATIONS

The results of the annual Census of Industry are published by the Dominion Bureau of Statistics in a series of industry and summary reports which are released each year as the compilations are completed. The summary reports for the **Manufacturing Industries** are listed below. A complete catalogue of publications of the Bureau is available on request from the Information Services Division, Dominion Bureau of Statistics, Ottawa, or from the Queen's Printer, Ottawa.

 $\begin{array}{cccc} \mathbf{A} - \mathbf{Annual} & \mathbf{Q} - \mathbf{Quarterly} & \mathbf{S.C.} - \mathbf{Special} \\ \mathbf{S.A.} - \mathbf{Semi-Annual} & \mathbf{M} - \mathbf{Monthly} & \mathbf{Compilation} \\ & \mathbf{O} - \mathbf{Occasional} & \end{array}$
